# Package ‘DataVisualizations’

October 10, 2023

**Type** Package

**Title** Visualizations of High-Dimensional Data

**Version** 1.3.2

**Date** 2023-10-09

**Maintainer** Michael Thrun <m.thrun@gmx.net>

**Description** Gives access to data visualisation methods that are relevant from the data scientist's point of view. The flagship idea of 'DataVisualizations' is the mirrored density plot (MD-plot) for either classified or non-classified multivariate data published in Thrun, M.C. et al.: ``Analyzing the Fine Structure of Distributions'' (2020), PLoS ONE, <DOI:10.1371/journal.pone.0238835>. The MD-plot outperforms the box-and-whisker diagram (box plot), violin plot and bean plot and geom_violin plot of ggplot2. Furthermore, a collection of various visualization methods for univariate data is provided. In the case of exploratory data analysis, 'DataVisualizations' makes it possible to inspect the distribution of each feature of a dataset visually through a combination of four methods. One of these methods is the Pareto density estimation (PDE) of the probability density function (pdf). Additionally, visualizations of the distribution of distances using PDE, the scatter-density plot using PDE for two variables as well as the Shepard density plot and the Bland-Altman plot are presented here. Pertaining to classified high-dimensional data, a number of visualizations are described, such as f.ex. the heat map and silhouette plot. A political map of the world or Germany can be visualized with the additional information defined by a classification of countries or regions. By extending the political map further, an uncomplicated function for a Choropleth map can be used which is useful for measurements across a geographic area. For categorical features, the Pie charts, slope charts and fan plots, improved by the ABC analysis, become usable. More detailed explanations are found in the book by Thrun, M.C.: ``Projection-Based Clustering through Self-Organization and Swarm Intelligence'' (2018) <DOI:10.1007/978-3-658-20540-9>.

**License** GPL-3

**Imports** Rcpp (>= 0.12.12), ggplot2, sp, pracma, reshape2

**Suggests** plyr, MBA, ggmap, plotrix, rworldmap, rgl, ABCanalysis, choroplethr, dplyr, R6, parallelDist, knitr (>= 1.12), rmarkdown (>= 0.9), vioplot, ggExtra, plotly, htmlwidgets, diptest, moments, signal, ggrepel, MASS, ROCit, ScatterDensity (>= 0.0.3), colorspace, viridis

---

## Description

Gives access to data visualisation methods that are relevant from the data scientist's point of view. The flagship idea of 'DataVisualizations' is the mirrored density plot (MD-plot) for either classified or non-classified multivariate data published in Thrun, M.C. et al.: "Analyzing the Fine Structure of Distributions" (2020), PLoS ONE, <DOI:10.1371/journal.pone.0238835>. The MD-plot outperforms the box-and-whisker diagram (box plot), violin plot and bean plot and geom_violin plot of ggplot2. Furthermore, a collection of various visualization methods for univariate data is provided. In the case of exploratory data analysis, 'DataVisualizations' makes it possible to inspect the distribution of each feature of a dataset visually through a combination of four methods. One of these methods is the Pareto density estimation (PDE) of the probability density function (pdf). Additionally, visualizations of the distribution of distances using PDE, the scatter-density plot using PDE for two variables as well as the Shepard density plot and the Bland-Altman plot are presented here. Pertaining to classified high-dimensional data, a number of visualizations are described, such as f.ex. the heat map and silhouette plot. A political map of the world or Germany can be visualized with the additional information defined by a classification of countries or regions. By extending the political map further, an uncomplicated function for a Choropleth map can be used which is useful for measurements across a geographic area. For categorical features, the Pie charts, slope charts and fan plots, improved by the ABC analysis, become usable. More detailed explanations are found in the book by Thrun, M.C.: "Projection-Based Clustering through Self-Organization and Swarm Intelligence" (2018) <DOI:10.1007/978-3-658-20540-9>.

## Details

For a brief introduction to **DataVisualizations** please see the vignette A Quick Tour in Data Visualizations.

Please see `https://www.deepbionics.org/`. Depending on the context please cite either [Thrun, 2018] regarding visualizations in the context of clustering or [Thrun/Ultsch, 2018] for other visualizations.

For the Mirrored Density Plot (MD plot) please cite [Thrun et al., 2020] and see the extensive vignette in `https://md-plot.readthedocs.io/en/latest/index.html`. The MD plot is also available in Python `https://pypi.org/project/md-plot/`

| HeatmapColors | Default color sequence for plots |
| ITS | Income Tax Share |
| InspectBoxplots | Inspect Boxplots |
| InspectCorrelation | Inspect the Correlation |
| InspectDistances | Inspection of Distance-Distribution |
| InspectScatterplots | Pairwise scatterplots and optimal histograms |
| InspectStandardization | QQplot of Data versus Normalized Data |
| InspectVariable | Visualization of Distribution of one variable |
| JitterUniqueValues | Jitters Unique Values |
| Lsun3D | Lsun3D inspired by FCPS [Thrun/Ultsch, 2020] introduced in [Thrun, 2018] |
| MAplot | Minus versus Add plot |
| MDplot | Mirrored Density plot (MD-plot) |
| MDplot4multiplevectors | Mirrored Density plot (MD-plot)for Multiple Vectors |
| MTY | Muncipal Income Tax Yield |
| Multiplot | Plot multiple ggplots objects in one panel |
| OptimalNoBins | Optimal Number Of Bins |
| PDEplot | PDE plot |
| ParetoDensityEstimation | Pareto Density Estimation V3 |

| | |
|---|---|
| ParetoRadius | ParetoRadius for distributions |
| Piechart | The pie chart |
| Pixelmatrix | Plot of a Pixel Matrix |
| Plot3D | 3D plot of points |
| PlotGraph2D | PlotGraph2D |
| PlotMissingvalues | Plot of the Amount Of Missing Values |
| PlotProductratio | Product-Ratio Plot |
| PmatrixColormap | P-Matrix colors |
| QQplot | QQplot with a Linear Fit |
| ROC | ROC plot |
| RobustNorm_BackTrafo | Transforms the Robust Normalization back |
| RobustNormalization | RobustNormalization |
| ShepardDensityScatter | Shepard PDE scatter |
| Sheparddiagram | Draws a Shepard Diagram |
| SignedLog | Signed Log |
| Silhouetteplot | Silhouette plot of classified data. |
| Slopechart | Slope Chart |
| StatPDEdensity | Pareto Density Estimation |
| Worldmap | plots a world map by country codes |
| categoricalVariable | A categorical Feature. |
| estimateDensity2D | estimateDensity2D |
| stat_pde_density | Calculate Pareto density estimation for ggplot2 plots |
| world_country_polygons | world_country_polygons |
| zplot | Plotting for 3 dimensional data |

## Examples

```
data("Lsun3D")
Data=Lsun3D$Data

Pixelmatrix(Data)

InspectDistances(as.matrix(dist(Data)))

MAlist=MAplot(ITS,MTY)

data("Lsun3D")
Cls=Lsun3D$Cls
Data=Lsun3D$Data
#clear cluster structure
plot(Data[,1:2],col=Cls)
#However, the silhouette plot does not indicate a very good clustering in cluster 1 and 2

Silhouetteplot(Data,Cls = Cls)

Heatmap(as.matrix(dist(Data)),Cls = Cls)
```

---

ABCbarplot *Barplot with Sorted Data Colored by ABCanalysis*

---

## Description

This plot can be read like a scree plot for PCA. It allowed to select the most important values visually.

## Usage

```
ABCbarplot(Data,

Colors=DataVisualizations::DefaultColorSequence[1:3],

main,xlab,ylab="Value")
```

## Arguments

| | |
|---|---|
| Data | [1:n] vector of Data, e.g. eigenvalues of PCA |
| Colors | three colors for A, B and C |
| main | title of plot |
| xlab | xlabel |
| ylab | ylabel |

## Details

ABC analysis is explained in **ABCanalysis**. The visualization is based on **ggplot2**.

## Value

List V of

| | |
|---|---|
| `ABCanalysis` | output of **ABCanalysis** |
| `ggobject` | object of **ggplot2** plotted |
| `DF` | Data frame if another plot should be done manually |

## Examples

```
data('FundamentalData_Q1_2018')
Data=as.matrix(FundamentalData_Q1_2018$Data)
Data[!is.finite(Data)]=0
results=prcomp(Data)
main="Scree plot with Class A of the Most-Important Eigenvalues"
plotlist = ABCbarplot(results$sdev,ylab='Eigenvalues',main=main)
plotlist$ggobject
```

---

`AccountingInformation_PrimeStandard_Q3_2019`
*Accounting Information in the Prime Standard in Q3 in 2019 (AI_PS_Q3_2019)*

---

## Description

Accounting Information of 261 companies traded in the Frankfurt stock exchange in the German Prime standard.

## Usage

```
data("AccountingInformation_PrimeStandard_Q3_2019")
```

## Format

A list with of three objects

`Key` [1:n] Key of the 261 obeservations

`Data` [1:n,1:d] numeric matrix of 261 observations on the 45 variables describing the accounting information

`Cls` [1:n] a numeric vector of k clusters of the clustering performend in [Thrun/Ultsch, 2019]

## Details

Detailed data description can be found in [Thrun/Ultsch, 2019].

## Source

Yahoo Finance

## References

## Examples

```
data(AccountingInformation_PrimeStandard_Q3_2019)

str(AI_PS_Q3_2019)
dim(AI_PS_Q3_2019$Data)
```

---

# `BimodalityAmplitude` *Bimodality Amplitude*

---

## Description

Computes the Bimodality Amplitude of [Zhang et al., 2003]

## Usage

```
BimodalityAmplitude(x, PlotIt=FALSE)
```

## Arguments

| | |
|---|---|
| `x` | Data vector. |
| `PlotIt` | FALSE, TRUE if a figure with the antimodes and peaks is plotted |

## Details

This function calculates the Bimodality Ampltiude of a data vector. This is a measure of the proportion of bimodality and the existence of bimodality. The value lies between zero and one (that is: [0,1]) where the value of zero implies that the data is unimodal and the value of one implies the data is two point masses.

## Note

function was rewritten after the flow of a function of Sathish Deevi because the original function was incorrect.

## Author(s)

Michael Thrun

## References

## Examples

```
#Example 1
data<-c(rnorm(299,0,1),rnorm(299,5,1))
BimodalityAmplitude(data,TRUE)

#Example 2
dist1<-rnorm(2100,5,2)
dist2<-dist1+11
data<-c(dist1,dist2)

BimodalityAmplitude(data,TRUE)

#Example 3
dist1<-rnorm(210,-15,1)
dist2<-rep(dist1,3)+30
data<-c(dist1,dist2)

BimodalityAmplitude(data,TRUE)

#Example 4
data<-runif(1000,-15,1)

BimodalityAmplitude(data,TRUE)
```

`categoricalVariable` *A categorical Feature.*

## Description

Character vector of length 391029 with five different labels.

## Usage

```
data("categoricalVariable")
```

## Examples

```
data(categoricalVariable)
unique(categoricalVariable)
```

`CCDFplot` *plot Complementary Cumulative Distribution Function (CCDF) in Log/Log uses ecdf, CCDF(x) = 1-cdf(x)*

## Description

plot Complementary Cumulative Distribution Function (CCDF) in Log/Log uses ecdf, CCDF(x) = 1-cdf(x)

## Arguments

| | |
|---|---|
| `Feature` | Vector of data to be plotted, or a matrix with given probability density function in column 2 and/or a cumulative density function in column 3 |
| `pch` | Optional, default: pch=0 for Line, other numbers see documentation about pch of plot |
| `PlotIt` | Optional, if PlotIt==T (default) do a plot, otherwise return only values |
| `LogLogPlot` | Optional, if LogLogPlot==T (default) do a log/log plot |
| `xlab` | Optional, xlab of plot |
| `ylab` | Optional, ylab of plot |
| `main` | Optional, main of plot |
| `...` | Optional, further arguments for plot |

## Value

V$CCDFuniqX,V$CCDFuniqY CCDFuniqY= 1-cdf(CCDFuniqX), such that plot(CCDFuniqX,CCDFuniqY)...)

## Author(s)

Michael Thrun

Choroplethmap *Plots the Choropleth Map*

## Description

A thematic map with areas colored in proportion to the measurement of the statistical variable being displayed on the map. A political map geneated by this function was used in the conference talk of the publication [Thrun/Ultsch, 2018].

## Usage

```
Choroplethmap(Counts, PostalCodes, NumberOfBins = 0,

 Breaks4Intervals, percentiles = c(0.5, 0.95),

 digits = 0, PostalCodesShapes, PlotIt = TRUE,

 DiscreteColors, HighColorContinuous = "red",

 LowColorContinuous = "deepskyblue1", NAcolor = "grey",

 ReferenceMap = FALSE, main = "Political Map of Germany",

 legend = "Range of values", Silent = TRUE)
```

## Arguments

`Counts` vector [1:m], statistical variable being displayed

`PostalCodes` vector[1:n], currently german postal codes (zip codes), if `PostalCodesShapes` is not changed manually, does not need to be unique

`NumberOfBins` Default: 1; 1 or below continously changes the color as defined by the package `choroplethr`. A Number between 2 and 9 sets equally sized bins. Higher numbers are not allowed

`Breaks4Intervals`
If NumberOfBins>1 you can set here the intervals of the bins manually

`percentiles` If NumberOfBins>1 and Breaks4Intervals not set, then the percentiles of min and max bin can be set here. See also `quantile`.

`digits` number of digits for `round`

`PostalCodesShapes`
Specially prepared shape file with postal codes and geographic boundaries. If you set this object, then you can use non german zip codes. You can see the required structure in map.df, github trulia choroplethr blob master r chloropleth. The German PostalCodesShapes can be downloaded from https://github.com/Mthrun/DataVisualizations/tree/master/data.

`PlotIt` Either Plot the map directly or change the object manually before plotting it

| | |
|---|---|
| `DiscreteColors` | Set the discrete colors manually if NumberOfBins>1, else it is ignored |
| `HighColorContinuous` | if NumberOfBins<=1: color of highest continuous value, else it is ignored |
| `LowColorContinuous` | if NumberOfBins<=1: color of lowest continuous value, else it is ignored |
| `NAcolor` | Color of NA values in the map (postal codes without any counts) |
| `ReferenceMap` | TRUE: With Google map, FALSE: without Google map |
| `main` | title of plot |
| `legend` | title of legend |
| `Silent` | TRUE: disable warnings of `choroplethr` package FALSE: enable warnings of `choroplethr` package |

## Details

This wrapper for the **choroplethr** enables to visualize a political map easily in the case of german zip codes based on given counts and postal codes. Other postal codes are in principle usable.

## Value

List of

| | |
|---|---|
| `chorR6obj` | An R6 object of the package `choroplethr` |
| `DataFrame` | Transformed PostalCodes and Counts in a way that they can be used in the package `choroplethr`. |

## Note

You could read https://www.r-bloggers.com/2016/05/case-study-mapping-german-zip-codes-in-r/, if you want to change the map (`PostalCodesShapes` shape object).

## See Also

Google `choroplethr` package.

## Examples

```
#If you download the package from CRAN
## Not run:
# 1. Step: Downlaod the shape file from the website
# https://github.com/Mthrun/DataVisualizations/blob/master/data/GermanPostalCodesShapes.rda
# 2. Step: load it from the local path od the downloaded file with
load(file='GermanPostalCodesShapes.rda')

## End(Not run)

# If you download the package from GitHub, you can omit the two steps above.
# Then, do not use the 'PostalCodesShapes' input parameter

#Many postal codes are required to see a structure
#Exemplary two postal codes in the upper left corner of the map

## Not run:
out=Choroplethmap(c(4,8,5,4),

c('49838', '26817', '49838', '26817'),

NumberOfBins=2,PlotIt=FALSE,
 PostalCodesShapes=GermanPostalCodesShapes)

out$chorR6obj$render()

## End(Not run)
#bins are only presented in the map if the have values within
## Not run:
out=Choroplethmap(c(4,8,5,4),c('49838', '26817',

 '49838', '26817'),NumberOfBins=5,

 Breaks4Intervals=c(1,2,3,5,10),PlotIt=FALSE,
 PostalCodesShapes=GermanPostalCodesShapes)

out$chorR6obj$render()

## End(Not run)
# Result of [Thrun/Ultsch, 2018]
# Slightly misuse the function for visualizing a political map
# resulting out of a clustering

## Not run:
data('ChoroplethPostalCodesAndAGS_Germany')
res=Choroplethmap(as.numeric(ChoroplethPostalCodesAndAGS_Germany$Cls)+1,

ChoroplethPostalCodesAndAGS_Germany$PLZ,NumberOfBins = 2,

Breaks4Intervals = c(0,1,2,3,4,5,6),digits = 1,ReferenceMap = F,
```

```
DiscreteColors = c('white','green','blue','red','magenta'),

main = 'Classification of German Postal Codes based on Income Tax Share and Yield',

legend = 'ITS vs MTY Classification in 2010',NAcolor = 'black',PlotIt=FALSE,
 PostalCodesShapes=GermanPostalCodesShapes)

#takes time to process
res$chorR6obj$render()

## End(Not run)
```

---

ChoroplethPostalCodesAndAGS_Germany
*Postal Codes and AGS of Germany for a Choropleth Map*

---

## Description

Zip Codes and Community Identification Number of Germany which can be used in a Choropleth Map.

## Usage

```
data("ChoroplethPostalCodesAndAGS_Germany")
```

## Format

A data frame with 8702 observations on the following 4 variables.

`PLZ` German postal codes/zip codes

`Cls` Clustering aggregated of germany postal codes by `MTY` and `ITS` features

`AGS` It is the 'Amtlicher Gemeindeschluessel' (Community Identification Number) of German municipalities

`Names` Names of municipalities

## Details

CLS are the the labels of a MTS versus ITS Bayesian classification showing two main groups of low quota ('1') and high quota ('2') municipalities. Additionally, outliers are manually classified into two separated groups called sponsors ('3') and promoted ('4'). In the Bayesian Classification non classified data have the label '0'. If a 'AGS' code of a 'PLZ' was unclear than the label is 'NaN'.

| Class | 0 | low quota | high quota | sponsors | promoted | non classified | unclear mapping |
|---|---|---|---|---|---|---|---|
| Labels | 0 | 1 | 2 | 3 | 4 | 5 | NaN |
| CountPerClass | 31 | 1325 | 7239 | 10 | 95 | 5 | 2 |

---

## Description

Boxplot the data for all classes

## Usage

```
ClassBoxplot(Data, Cls,  ColorSequence = DataVisualizations::DefaultColorSequence,

 ClassNames = NULL,All=FALSE, PlotLegend = TRUE,

 main = 'Boxplot per Class', xlab = 'Classes', ylab = 'Range of Data')
```

## Arguments

| | |
|---|---|
| `Data` | Vector of the data to be plotted |
| `Cls` | Vector of class identifiers. |
| `ColorSequence` | Optional: The sequence of colors used, Default: DefaultColorSequence() |
| `ClassNames` | Optional: The names of the classes. Default: C1 - C(Number of Classes) |
| `All` | Optional: adds full data vector for comparison against classes |
| `PlotLegend` | Optional: Add a legent to plot. Default: TRUE) |
| `main` | Optional: Title of the plot. Default: "ClassBoxPlot"" |
| `xlab` | Optional: Title of the x axis. Default: "Classes" |
| `ylab` | Optional: Title of the y axis. Default: "Data" |

## Value

A List of

| | |
|---|---|
| `ClassData` | The DataFrame used to plot |
| `ggobject` | The ggplot2 plot object |

in mode `invisible`

## Author(s)

Michael Thrun, Felix Pape

## Examples

```
data(ITS)
#please download package from cran
#model=AdaptGauss::AdaptGauss(ITS)
#Classification=AdaptGauss::ClassifyByDecisionBoundaries(ITS,

#DecisionBoundaries = AdaptGauss::BayesDecisionBoundaries(model$Means,model$SDs,model$Weights))

DataVisualizations::ClassBoxplot(ITS,Classification)$ggobject
```

---

`ClassErrorbar` *ClassErrorbar*

---

## Description

Plots ClassErrorbars at Xvalue positions for one or more than one classes with user means and defined whiskers

## Usage

```
ClassErrorbar(Xvalues, Ymatrix, Cls, ClassNames, ClassCols, ClassShape,

MeanFun = median, SDfun, JitterPosition = 0.5,

main = "Error bar plot", xlab, ylab, WhiskerWidth = 7, Whisker_lwd = 1, BW = TRUE)
```

## Arguments

| | |
|---|---|
| `Xvalues` | [1:m] Numerical or character vector, positions of error bars (see details) in on x-axis for the m variables |
| `Ymatrix` | [1:n,1:d] of n cases and d=m*k variables with for which the error-bar statistics defined by MeanFun and SDfun should be computed |
| `Cls` | Optional, [1:d] numerical vector of k classes for the d variables. Each class is one method that will be shown as distinctive set of error bars in the plot |
| `ClassNames` | Optional, [1:k] character vector of k methods |
| `ClassCols` | Optional, [1:k] character vector of k colors |
| `ClassShape` | Optional, [1:k] numerical vector of k shapes, see pch in `Classplot` for details |
| `MeanFun` | Optional, error bar statstic of mean points, default=median |
| `SDfun` | Optional, error bar statstic for the length of whiskers, default is the robust estimation of standard deviation |
| `JitterPosition` | Optional, how much in values of Xvalues should the error bars jitter around Xvalues to not overlap |
| `main` | Optional, title of plot |
| `xlab` | Optional, x-axis label |
| `ylab` | Optional, y-axis label |
| `WhiskerWidth` | Optional, scalar above zero defining the width of the end of the whiskers |
| `Whisker_lwd` | Optional, scalar obove zero defining the thickness of the whisker lines |
| `BW` | Optional, FALSE: usual ggplot2 background and style which is good for screen visualizations. Default: TRUE: theme_bw() is used which is more appropriate for publications |

## Details

If k=1, e.g., one method is used, d=m and Cls=rep(1,m). All vector [1:k] assume the occurance of the classes in Cls as ordered with increasing value.

Statistics are provided in long table format with the column names Xvalues, Mean, SD and Method. The method column specifies the names of the k classes.

If `Xvalues` is a character vector (see example), ggplot2 automatically sets the position on the x-axis. Otherwise specific numeric positions can be set. This allowes also for plotting a smooth line over the average (see example).

## Value

List with

| | |
|---|---|
| `ggobj` | The ggplot object of the ClassErrorbar |
| `Statistics` | [1:(d*k)1:4] data frame of statstics per class used for plotting |

## Author(s)

Michael Thrun

### Examples

```
data('FundamentalData_Q1_2018')
Data=as.matrix(FundamentalData_Q1_2018$Data)
Cls = FundamentalData_Q1_2018$Cls
Class1Data = matrix(NA, nrow = nrow(Data), ncol = 2)
Class2Data = matrix(NA, nrow = nrow(Data), ncol = 2)
Class1Data[which(Cls==1), ] = Data[which(Cls==1), c("TotalAssets", "TotalLiabilities")]
Class2Data[which(Cls==2), ] = Data[which(Cls==2), c("TotalAssets", "TotalLiabilities")]
YMatrix = cbind(Class1Data,
                Class2Data)

#Option 1: character vector
ClassErrorbar(c("TotalRevenue","GrossProfit"),
         YMatrix, c
 (1,1,2,2),
         ClassNames=c("Class 1", "Class 2"),
         main="ClassErrorbar of Q1 2018 for total revenue and gross profit",
         xlab="GrossProfit/TotalRevenue",
         ylab="Median +- std",
         WhiskerWidth = 1)

#Option 2: numerical vector
ClassErrorbar(c(1,2),
 YMatrix,
 c(1,1,2,2),
         ClassNames=c("Class 1", "Class 2"),
         main="ClassErrorbar of Q1 2018 for total revenue and gross profit",
         xlab="GrossProfit/TotalRevenue",
         ylab="Median +- std",
         WhiskerWidth = 1)

#Option 3: numerical vector + line
## Not run:
#arbitrary data
Y_someOtherData=cbind(YMatrix,YMatrix,
YMatrix,YMatrix)
some_values=c(2,3,4,5,6,8,9,10)
ClassErrorbar(some_values,
 Y_someOtherData,
 c(1,1,2,2),
         ClassNames=c("Class 1", "Class 2"),
         main="ClassErrorbar of Q1 2018 for total revenue and gross profit",
         xlab="GrossProfit/TotalRevenue",
         ylab="Median +- std",
         WhiskerWidth = 1)$ggobj+
geom_smooth(method="auto", se=F, fullrange=F, level=0.95)

## End(Not run)
```

---

## ClassMDplot *Class MDplot for Data w.r.t. all classes*

---

## Description

Creates a Mirrored-Density plot w.r.t. to each class of a numerical vector of data.

## Usage

```
ClassMDplot(Data, Cls, ColorSequence = DataVisualizations::DefaultColorSequence,

                        ClassNames = NULL, PlotLegend = TRUE,Ordering = "Columnwise",

                              main = 'MDplot for each Class',

                              xlab = 'Classes', ylab = 'PDE of Data per Class',

                              Fill = 'darkblue', MinimalAmoutOfData=40,

                              MinimalAmoutOfUniqueData=12,SampleSize=1e+05,...)
```

## Arguments

| | |
|---|---|
| `Data` | [1:n] Vector of the data to be plotted |
| `Cls` | [1:n] Vector of class identifiers of k clusters one number is the label of one cluster |
| `ColorSequence` | Optional: [1:k] vector, The sequence of colors used, Default: DataVisualizations::DefaultColorSequence |
| `ClassNames` | Optional: [1:k] named numerical vector, The names of the classes. Default: Class 1 - Class k with k beeing the number of classes |
| `PlotLegend` | Optional: Add a legent to plot. Default: TRUE) |
| `Ordering` | Optional: Ordering of Classes, please see `MDplot` for details) |
| `main` | Optional: Title of the plot. Default: MDplot for each Class |
| `Fill` | Optional: [1:k] Vector with the colors, the MD's are to be colored with. If only one value is given, all MD's are colored in the same color. |
| `xlab` | Optional: Title of the x axis. Default: "Classes" |
| `ylab` | Optional: Title of the y axis. Default: "Data" |
| `MinimalAmoutOfData` | Optional: numeric value defining a threshold. Below this threshold no density estimation is performed and a Jitter plot with a median line is drawn. Please see `MDplot` for details. |
| `MinimalAmoutOfUniqueData` | Optional: numeric value defining a threshold. Below this threshold no density estimation and statistical testing is performed and a Jitter plot is drawn. Only Data Science experts should change this value after they understand how the density is estimated (see [Ultsch, 2005]). |
| `SampleSize` | Optional: numeric value defining a threshold. Above this thresholdclass-wise uniform sampling of finite cases is performed in order to shorten computation time. If required, `SampleSize=n` can be set to omit this procedure. |

... Further arguments that are documented in `MDplot` except for `OnlyPlotOutput` which is always true.

## Details

Further examples for the ClassMDplot can be found in https://md-plot.readthedocs.io/en/latest/application/example_application.html.

The `Cls` vector is reordered from lowest to highest number. The `ClassNames` vector and `ColorSequence` vectors are matched by this ordering of `Cls`, i.e. the lowest number gets the first color or class name.

## Value

A List of

`ClassData` The matrix [1:m,1:NoOfClasses] used to plot with the reordered Cls, rows are filled partly with NaN, m is the length of the number of data in largest class.

`ggobject` The ggplot2 plot object

in mode `invisible`

## Note

Function is still experimental because `ColorSequence` does not work yet, because we are unable to specify the colors in ggplot2. If someone knows a solution, please mail the maintainer of the package. Similar issue for `PlotLegend`.

## Examples

```
data(ITS)

#shortcut for example if AdaptGauss not installed
Classification = kmeans(ITS, centers = 2)$cluster
```

```
#better approach
#please download package from cran
#model=AdaptGauss::AdaptGauss(ITS)
#Classification=AdaptGauss::ClassifyByDecisionBoundaries(ITS,

#DecisionBoundaries = AdaptGauss::BayesDecisionBoundaries(model$Means,model$SDs,model$Weights))
ClassNames=c(1,2)
names(ClassNames)=c("Insert name \n of Class 1","Insert name \n  of Class 2")
ClassMDplot(ITS,Classification,ClassNames = ClassNames)
```

---

ClassPDEplot *PDE Plot for all classes*

---

## Description

PDEplot the data for all classes, weights the pdf with priors

## Usage

```
ClassPDEplot(Data, Cls, ColorSequence,

 ColorSymbSequence, PlotLegend = 1,

 SameKernelsAndRadius = 0, xlim, ylim, ...)
```

## Arguments

| | |
|---|---|
| Data | The Data to be plotted |
| Cls | Vector of class identifiers. Can be integers or NaN's, need not be consecutive nor positive |
| ColorSequence | Optional: the sequence of colors used, Default: DefaultColorSequence |
| ColorSymbSequence | Optional: the plot symbols used (theoretisch nicht notwendig, da erst wichtig, wenn mehr als 562 Cluster) |
| PlotLegend | Optional: add a legent to plot (default == 1) |
| SameKernelsAndRadius | Optional: Use the same PDE kernels and radii for all distributions (default == 0) |
| xlim | Optional: range of the x axis |
| ylim | Optional: range of the y axis |
| ... | further arguments passed to plot |

## Value

Kernels of the Pareto density estimation in mode `invisible`

### Author(s)

Michael Thrun

### Examples

```
data(ITS)
#please download package from cran
#model=AdaptGauss::AdaptGauss(ITS)
#Classification=AdaptGauss::ClassifyByDecisionBoundaries(ITS,

#DecisionBoundaries = AdaptGauss::BayesDecisionBoundaries(model$Means,model$SDs,model$Weights))

DataVisualizations::ClassPDEplot(ITS,Classification)$ggobject
```

---

## ClassPDEplotMaxLikeli *Create PDE plot for all classes with maximum likelihood*

---

### Description

PDEplot the data for allclasses, weight the Plot with 1 (= maximum likelihood)

### Usage

```
ClassPDEplotMaxLikeli(Data, Cls, ColorSequence = DataVisualizations::DefaultColorSequence,

 ClassNames, PlotLegend = TRUE, MinAnzKernels = 0,PlotNorm,

 main = "Pareto Density Estimation (PDE)",

 xlab = "Data", ylab = "ParetoDensity", xlim, ylim, lwd=1, ...)
```

### Arguments

| | |
|---|---|
| Data | The Data to be plotted |
| Cls | Vector of class identifiers. Can be integers or NaN's, need not be consecutive nor positive |
| ColorSequence | Optional: the sequence of colors used, Default: DefaultColorSequence |
| ClassNames | Optional: the names of the classes to be displayed in the legend |
| PlotLegend | Optional: add a legent to plot (default == 1) |
| MinAnzKernels | Optional: Minimum number of kernels |
| PlotNorm | Optional: ==1 => plot Normal distribuion on top , ==2 = plot robust normal distribution,; default: PlotNorm= 0 |

| | |
|---|---|
| `main` | Optional: Title of the plot |
| `xlab` | Optional: title of the x axis |
| `ylab` | Optional: title of the y axis |
| `xlim` | Optional: area of the x-axis to be plotted |
| `lwd` | Optional: area of the y-axis to be plotted |
| `ylim` | numerical scalar defining the width of the lines |
| `...` | further arguments passed to plot |

## Value

| | |
|---|---|
| `Kernels` | Kernels of the distributions |
| `ClassParetoDensities` | Pareto densities for classes |
| `ggobject` | ggplot2 plot object. This should be used to further modify the plot |

## Author(s)

Felix Pape

## Examples

```
data(ITS)
#model=AdaptGauss::AdaptGauss(ITS)
##please download package from cran
#Classification=AdaptGauss::ClassifyByDecisionBoundaries(ITS,

#DecisionBoundaries = AdaptGauss::BayesDecisionBoundaries(model$Means,model$SDs,model$Weights))

DataVisualizations::ClassPDEplotMaxLikeli(ITS,Classification)$ggobject
```

Classplot *Classplot*

## Description

Allows to plot one time series or feauture with a classification as a labeled scatter plot with a line. The colors are the labels defined by the classification.

## Usage

```
Classplot(X, Y, Cls, Plotter,Names = NULL, na.rm = FALSE,

xlab = "X", ylab = "Y", main = "Class Plot", Colors = NULL,

Size = 8,PointBorderCol="black",

LineColor = NULL, LineWidth = 1, LineType  = NULL,

Showgrid  = TRUE, pch,  AnnotateIt = FALSE, SaveIt = FALSE,

Nudge_x_Names = 0, Nudge_y_Names = 0, Legend = "", ...)
```

## Arguments

| | |
|---|---|
| X | [1:n] numeric vector or time |
| Y | [1:n] numeric vector of feature |
| Cls | [1:n] numeric vector of k classes, if not set per default every point is in first class |
| Names | [1:n] character vector of k classes, if not set per default Cls is used, if set, names the legend and the points |
| na.rm | Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| xlab | Optional, string for xlabel |
| ylab | Optional, string for ylabel |
| main | Optional, string for title of plot |
| Colors | Optional, [1;k] string defining the k colors, one per class |
| AnnotateIt | Optional, in case of `Plotter==ggplot` and given `Names` annotates each point if TRUE |
| Size | Optional, size of points, beware: default is appropriate for "`plotly`", or "`native`" but should smaller for "`ggplot`" |
| PointBorderCol | Optional, string, color of the dot outline for "`plotly`" for "`ggplot`". If `FALSE` and `Plotter="ggplot"` or `Plotter="plotly"`, no borders for points which is useful if many points overlap. |
| LineColor | Optional, name of color, in plotly then all points are connected by a curve,<br>in ggplot2 all points of one class ae connected by a curve of the color the class |

LineWidth — Optional, number defining the width of the curve (plotly only)

LineType — Optional, string defining the type of the curve in plotly only, "dot", "dash", "-" for ggplot2: just set =1 here and then the curve is plotted

Showgrid — Optional, boolean (plotly only)

Plotter — Optional, either "ggplot" (default if Names given), "plotly" (default if no Names given), or "native"

pch — [1:n] numeric vector of length n of the cases of Cls for the k classes. It defines the symbols to use, for native Plotter or ggplot, usally k can be in a range from zero to 25

SaveIt — Optional, boolean, if true saves plot as html (plotly) or png (ggplot2)

Nudge_x_Names — Optional, numerical scalar, for Plotter "ggplot" only, if Names are set, moves them consistently respective to x-axis within units of x-axis

Nudge_y_Names — Optional, numerical scalar, for Plotter "ggplot" only, if Names are set, moves them consistently respective to y-axis within units of y-axis

Legend — Optional, if argument is not missing, character string defining the title of the legend which automatically enables the legend

... — Further arguments for ggplot2::ggplot,or plotly::plot_ly, or plot (except "pch"" and "type") depending on Plotter

## Details

Default is "plotly" if Names are NULL. However, ggplot2 is preferable in case that Names parameter is used because overlapping text labels are avoided. In that case the default is "ggplot". Note that ggplot2 options are currently slightly restricted.

For example, the function is usefull to see if temporal clustering has time dependent variations and for Hidden Markov Models (see Mthrun/RHmm on GitHub).

## Value

plotly object or ggplot2 objected depending on Plotter

## Author(s)

Michael Thrun

## See Also

DualaxisClassplot

## Examples

```
data(Lsun3D)
Classplot(Lsun3D$Data[,1],Lsun3D$Data[,2],Lsun3D$Cls)

#ggplot 2 with different symbols
  Classplot(
    Lsun3D$Data[, 1],
```

```
    Lsun3D$Data[, 2],
    Lsun3D$Cls,
    Plotter = "ggplot2",
    Size = 3,
    pch = Lsun3D$Cls + 5
  )

#plotly with line
data(Lsun3D)
Classplot(Lsun3D$Data[,1],Lsun3D$Data[,2],Lsun3D$Cls,
LineType="-",LineColor = "green")

#ggplot2 with annotations
data(Lsun3D)
ind=sample(1:nrow(Lsun3D$Data),20)
Classplot(Lsun3D$Data[ind,1],Lsun3D$Data[ind,2],Lsun3D$Cls[ind],
Names = rownames(Lsun3D$Data)[ind],Size =1,
Plotter = "ggplot2",AnnotateIt = TRUE)

#ggplot2 with labels and legend per class
data(Lsun3D)
Classplot(Lsun3D$Data[,1],Lsun3D$Data[,2],Lsun3D$Cls,
Names = paste0("C",Lsun3D$Cls),Size =2,Legend ="Classes")
```

---

`CombineCols` *Combine vectors of various lengths*

---

## Description

Combine arbitrary vectors of data, filling in missing rows with NaN

## Usage

```
CombineCols(...)
```

## Arguments

| | |
|---|---|
| `...` | d vectors of arbitrary lengths, see example |

## Details

Robust alternative to `cbind` that fills missing values with nan instead of extending length of vector by duplicating elements

## Value

matrix of dimensionality of n x d with n beeing the length of the longest vector and d the number of vectors given as input

## Note

special application by MCT of rowr cbind.fill which is now not on CRAN anymore

## Author(s)

Craig Varrichio

## Examples

```
CombineCols(c(1,2,3),c(1),c(2,3))
```

---

`Crosstable` *Crosstable plot*

---

## Description

Presents a heatmap with values and a cross table of given Data matrix of two features and a bin width or percentualized values. In this approach the bin width is fixes. A more general way to approach this is the kernel density estimation plot of `PDEscatter`.

## Usage

```
Crosstable(Data, xbins = seq(0, 100, 5), ybins = xbins,

NormalizationFactor = 1, PlotIt = TRUE, main='Cross Table',

PlotText=TRUE,TextDigits=0,TextProbs=c(0.05,0.95))
```

## Arguments

| | |
|---|---|
| `Data` | [1:n,1:2] matrix of two features from which the cross table should be generated from |
| `xbins` | [1:k] start of k bins as a vector generated with `seq` of the first feature of data. Default setting assumes percentiled values between zero and 100. |
| `ybins` | [1:k] start of k bins as a vector generated with `seq` of the second feature of data. Normally the same for both features, other settings are only possible if the length `k` is equal. |
| `NormalizationFactor` | Optional, Data feautures can be seen as regular time series, e.g. 1 measurement for a minute, in this case it is useful to normalize the output, e.g. to hours, then `NormalizationFactor=60` |
| `PlotIt` | Optional, Plots the heatmap if `TRUE`. The first feature is on the x-axis (left to right) and the second on y-axis (bottom to top). |
| `main` | In case of for `PlotIt=TRUE`: title of plot, see `title` |
| `PlotText` | In case of for `PlotIt=TRUE`: Default TRUE: plots text in heatmap with the values of the crosstable |

TextDigits
: In case of for `TextDigits=TRUE`: integer indicating the number of decimal places to use in `round`.

TextProbs
: In case of for `TextDigits=TRUE`: [1:2] numeric vector of two probabilities defining the thresholds for white text to grey text and grey text to black text, e.g. below the first threshold (Default 0.05) all values (5% of values) will be printed in white because the lowest values of the heatmap are blue. The second value of 0.95 works well if cross table has many zeros; uses `quantile` internally.

## Details

The interval in each bin is closed to the left and opened to the right. The cross table can be seen as a two-dimensional histogram. The idea to add histograms to the table is taken from [Charpentier. 2014].

## Value

The cross table in `invisible` mode which depicts the number of values (frequency) in an specific range with regard to two features.

The first feature is on the x-axis (left to right), and the second on y-axis (top to bottom) contrary to the plot where it is bottom to top.

## Note

For non percentiled values the `PlotText` part does not seem always to work, but I currently dont know why the text does not always overlap with the heatmap.

## Author(s)

Michael Thrun

## References

[Charpentier. 2014] Charpentier, Arthur, ed. Computational actuarial science with R. CRC Press, 2014.

## See Also

`table`, `image`, `PDEscatter`

## Examples

```
data(ITS)
data(MTY)
#simple but not a good transformation
Data=(cbind(ITS/max(ITS),MTY/max(MTY)))*100
#choice for bins could be better
Crosstable(Data)
```

## DefaultColorSequence *Default color sequence for plots*

### Description

Defines the default color sequence for plots made within the Projections package.

### Usage

```
data("DefaultColorSequence")
```

### Format

A vector with 562 different strings describing colors for plots.

## DensityContour *Contour plot of densities*

### Description

Density estimation (PDE) [Ultsch, 2005] or "SDH" [Eilers/Goeman, 2004] used for a density contour plot.

### Usage

```
DensityContour(X,Y, DensityEstimation="SDH",

SampleSize, na.rm=FALSE,PlotIt=TRUE,

NrOfContourLines=20,Plotter='ggplot', DrawTopView = TRUE,

xlab, ylab, main="DensityContour",

xlim, ylim, Legendlab_ggplot="value",

AddString2lab="",NoBinsOrPareto=NULL,...)
```

### Arguments

`X` Numeric vector [1:n], first feature (for x axis values)

`Y` Numeric vector [1:n], second feature (for y axis values)

`DensityEstimation` "SDH" is very fast but maybe not correct, "PDE" is slow but proably more correct, third alternativ is the typical R density estimation with "kde2d" which is sensitive to parameters

| | |
|---|---|
| `SampleSize` | Numeric, positiv scalar, maximum size of the sample used for calculation. High values increase runtime significantly. The default is that no sample is drawn |
| `na.rm` | Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| `PlotIt` | `TRUE`: plots with function call<br>`FALSE`: Does not plot, plotting can be done using the list element `Handle` |
| `NrOfContourLines` | Numeric, number of contour lines to be drawn. 20 by default. |
| `Plotter` | String, name of the plotting backend to use. Possible values are: `"ggplot"`, `"plotly"`. Default: ggplot |
| `DrawTopView` | Boolean, True means contur is drawn, otherwise a 3D plot is drawn. Default: TRUE |
| `xlab` | String, title of the x axis. Default: "X", see `plot()` function |
| `ylab` | String, title of the y axis. Default: "Y", see `plot()` function |
| `main` | string, the same as "main" in `plot()` function |
| `xlim` | see `plot()` function |
| `ylim` | see `plot()` function |
| `Legendlab_ggplot` | String, in case of `Plotter="ggplot"` label for the legend. Default: "value" |
| `AddString2lab` | adds the same string of information to x and y axis label, e.g. usefull for adding SI units |
| `NoBinsOrPareto` | Density specifc parameters, for `PDEscatter(ParetoRadius)` or SDH (nbins)) or kde2d(bins) |
| `...` | further plot arguments |

## Details

The `DensityContour` function generates the density of the xy data as a z coordinate. Afterwards xyz will be plotted either as a contour plot or a 3d plot. It assumens that the cases of x and y are mapped to each other meaning that a `cbind(x,y)` operation is allowed. This function plots the Density on top of a scatterplot. Variances of x and y should not differ by extreme numbers, otherwise calculate the percentiles on both first. If `DrawTopView=FALSE` only the plotly option is currently available. If another option is chosen, the method switches automatically there.

`PlotIt=FALSE` is usefull if one likes to perform adjustements like axis scaling prior to plotting with **ggplot2** or **plotly**.

## Value

List of:

| | |
|---|---|
| `X` | Numeric vector [1:m],m<=n, first feature used in the plot or the kernels used |
| `Y` | Numeric vector [1:m],m<=n, second feature used in the plot or the kernels used |
| `Densities` | Number of points within the ParetoRadius of each point, i.e. density information |
| `Handle` | Handle of the plot object |

### Note

MT contributed with several adjustments

### Author(s)

Felix Pape

### Examples

```
#taken from [Thrun/Ultsch, 2018]
data("ITS")
data("MTY")
Inds=which(ITS<900&MTY<8000)
plot(ITS[Inds],MTY[Inds],main='Bimodality is not visible in normal scatter plot')

DensityContour(ITS[Inds],MTY[Inds],DensityEstimation="SDH",xlab = 'ITS in EUR',

ylab ='MTY in EUR' ,main='Smoothed Densities histogram indicates Bimodality' )

DensityContour(ITS[Inds],MTY[Inds],DensityEstimation="PDE",xlab = 'ITS in EUR',

ylab ='MTY in EUR' ,main='PDE indicates Bimodality' )
```

---

## `DensityScatter` *Scatter plot with densities*

---

### Description

Density estimation is performed by (PDE) [Ultsch, 2005] or "SDH" [Eilers/Goeman, 2004] and visualized in a density scatter plot [Brinkmann et al., 2023] in which the points are colored by their density.

## Usage

```
DensityScatter(X,Y,DensityEstimation="SDH",

Type="DDCAL", Plotter = "native",Marginals = FALSE,

SampleSize,na.rm=FALSE, xlab, ylab,

main="DensityScatter", AddString2lab="",

xlim, ylim,NoBinsOrPareto=NULL,...)
```

## Arguments

| | |
|---|---|
| `X` | Numeric vector [1:n], first feature (for x axis values) |
| `Y` | Numeric vector [1:n], second feature (for y axis values) |
| `DensityEstimation` | (Optional), `"SDH"` is very fast but maybe not correct, `"PDE"` is slow but proably more correct, third alternativ is the typical R density estimation with `"kde2d"` which is sensitive to parameters |
| `Type` | (Optional), `"DDCAL"` uses a new density to point color matching by DDCAL algorithm [Lux/Rinderle-Ma, 2023] , `"native"` uses a simple density to point color matching |
| `Plotter` | in case of `Type="DDCAL"`, (Optional) String, name of the plotting backend to use. Possible values are: `"native"`,`"plotly"`, or `"ggplot2"` |
| `Marginals` | (Optional) Boolean, if TRUE the marginal distributions of X and Y will be plotted together with the 2D density of X and Y. Default is FALSE |
| `SampleSize` | (Optional), Numeric, positiv scalar, maximum size of the sample used for calculation. High values increase runtime significantly. The default is that no sample is drawn |
| `na.rm` | (Optional), Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| `xlab` | (Optional), String, title of the x axis. Default: "X", see `plot()` function |
| `ylab` | (Optional), String, title of the y axis. Default: "Y", see `plot()` function |
| `main` | (Optional), string, the same as "main" in `plot()` function |
| `AddString2lab` | (Optional), adds the same string of information to x and y axis label, e.g. usefull for adding SI units |
| `xlim` | (Optional), in case of `Type="natuive"`, see `plot()` function |
| `ylim` | in case of `Type="natuive"`, see `plot()` function |
| `NoBinsOrPareto` | (Optional), in case of `Type="natuive"`, Density specifc parameters, for `PDEscatter(ParetoRadius)` or SDH (nbins)) or kde2d(bins) |
| `...` | (Optional), further arguments either to ScatterDenstiy::DensityScatter.DDCAL or to plot() |

## Details

The `DensityScatter` function generates the density of the xy data as a z coordinate. Afterwards xy points will be plotted as a scatter plot, where the z values defines the coloring of the xy points. It assumens that the cases of x and y are mapped to each other meaning that a `cbind(x,y)` operation is allowed. This function plots the Density on top of a scatterplot. Variances of x and y should not differ by extreme numbers, otherwise calculate the percentiles on both first.

## Value

List of:

| | |
|---|---|
| `X` | Numeric vector [1:m],m<=n, first feature used in the plot or the kernels used |
| `Y` | Numeric vector [1:m],m<=n, second feature used in the plot or the kernels used |
| `Densities` | Number of points within the ParetoRadius of each point, i.e. density information |

# DualaxisClassplot *Dualaxis Classplot*

---

## Description

Allows to plot two time series or features with one or two classification(a) as labeled scatter plots. The colors are the labels defined by the classification. Usefull to see if temporal clustering has time dependent variations and for Hidden Markov Models (see Mthrun/RHmm on GitHub).

## Usage

```
DualaxisClassplot(X, Y1, Y2, Cls1,

Cls2, xlab = "X", y1lab = "Y1", y2lab = "Y2",

main = "Dual Axis Class Plot", Colors, Showgrid = TRUE, SaveIt = FALSE)
```

## Arguments

| | |
|---|---|
| X | [1:n] numeric vector or time |
| Y1 | [1:n] numeric vector of feauture |
| Y2 | [1:n] numeric vector of feauture |
| Cls1 | [1:n] numeric vector defining a classification of k1 classes |
| Cls2 | Optional, [1:n] numeric vector defining a classification of k2 classes for Y2 |
| xlab | Optional, string |
| y1lab | Optional, string |
| y2lab | Optional, string |
| main | Optional, string |

| | |
|---|---|
| Colors | [1:(k1+k2)] Colornames |
| Showgrid | Optional, boolean |
| SaveIt | Optional, boolean |

## Value

plotly object

## Author(s)

Michael Thrun

## See Also

Classplot

## Examples

---

DualaxisLinechart *DualaxisLinechart*

---

## Description

A line chart with dual axisSS

## Usage

```
DualaxisLinechart(X, Y1, Y2, xlab = "X",

y1lab = "Y1", y2lab = "Y2", main = "Dual Axis Line Chart",

cols = c("black", "blue"),Overlaying="y", SaveIt = FALSE)
```

## Arguments

| | |
|---|---|
| X | [1:n] vector, both lines require the same xvalues, e.g. the time of the time series, POSIXlt or POSIXct are accepted |
| Y1 | [1:n] vector of first line |
| Y2 | [1:n] vector of second line |
| xlab | Optional, string for xlabel |
| y1lab | Optional, string for first ylabel |
| y2lab | Optional, string for second ylabel |
| main | Optional, title of plot |
| cols | Optional, color of two lines |

| | |
|---|---|
| `Overlaying` | Change only default in case of using `subplot` |
| `SaveIt` | Optional, default FALSE; TRUE if you want to save plot as html in `getwd()` directory |

### Details

enables to visualize to lines in one plot overlaying them using ploty (e.g. two time series with two ranges of values)

### Value

`plotly` object

### Author(s)

Michael Thrun

### Examples

```
#subplot renames the numbering of subsequent plots
y1=runif(100,0,1)
y2=rnorm(100,m=5,s=1)
DualaxisLinechart(1:100, y1, y2,main="Random Time series")

y1=runif(100,0,1)
y2=(1:100*3+4)*runif(100,0,1)
p1=DualaxisLinechart(1:100, y1, y2,main="Random Time series",Overlaying="y2")

y3=1:100*(-2)+4
y4=rnorm(100,m=0,s=2)
p2=DualaxisLinechart(1:100, y3, y4,main="Random Time series",Overlaying="y4")
plotly::subplot(p1,p2)
```

---

## `estimateDensity2D` *estimateDensity2D*

---

### Description

Estimates densities for two-dimensional data with the given estimation type

### Usage

```
estimateDensity2D(X, Y, DensityEstimation = "SDH",

SampleSize, na.rm = FALSE, NoBinsOrPareto = NULL)
```

### Arguments

| | |
|---|---|
| `X` | [1:n] numerical vector of first feature |
| `Y` | [1:n] numerical vector of second feature |
| `DensityEstimation` | Either "PDE","SDH" or "kde2d" |
| `SampleSize` | Sample Size in case of big data |
| `na.rm` | Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| `NoBinsOrPareto` | Density specifc parameters, for PDEscatter(ParetoRadius) or SDH (nbins)) or kde2d(bins) |

### Details

Each two-dimensional data point is defined by its corresponding X and Y value.

### Value

List V with

| | |
|---|---|
| `X` | [1:m] numerical vector of first feature, m<=n depending if all values are finite an na.rm parameter |
| `Y` | [1:m] numerical vector of second feature, m<=n depending if all values are finite an na.rm parameter |
| `Densities` | the density of each two-dimensional data point |

Y=rnorm(100)
#V=estimateDensity2D(X,Y)
```

---

`Fanplot` *The fan plot*

---

## Description

The better alternative to the pie chart represents amount of values given in data.

## Usage

```
Fanplot(Datavector,Names,Labels,MaxNumberOfSlices,main='',col,
MaxPercentage=FALSE,ShrinkPies=0.05,Rline=1.1, lwd=2,LabelCols="black",...)
```

## Arguments

| | |
|---|---|
| `Datavector` | [1:n] a vector of n non unique values |
| `Names` | Optional, [1:k] names to search for in Datavector, if not set `unique` of Datavector is calculated. |
| `Labels` | Optional, [1:k] Labels if they are specially named, if not Names are used. |
| `MaxNumberOfSlices` | Default is k, integer value defining how many labels will be shown. Everything else will be summed up to `Other`. |
| `main` | Optional, title below the fan pie, see `plot` |
| `col` | Optional, the default are the first [1:k] colors of the default color sequence used in this package, otherwise a character vector of [1:k] specifying the colors analog to `plot` |
| `MaxPercentage` | default FALSE; if true the biggest slice is 100 percent instead of the biggest procentual count |
| `ShrinkPies` | Optional, distance between biggest and smallest slice of the pie |
| `Rline` | Optional, the distance between text and pie is defined here as the length of the line in numerical numbers |
| `lwd` | Optional, The line width, a positive number, defaut is 2 |
| `LabelCols` | Color of labels |
| `...` | Further arguments to `fan.plot` like circumferential positions for the labels `labelpos` or additional arguments passed to `polygon` |

## Details

A normal pie plot is dificult to interpret for a human observer, because humans are not trained well to observe angles [Gohil, 2015, p. 102]. Therefore, the fan plot is used. As proposed in [Gohil 2015] the `fan.plot()` of the `plotrix` package is used to solve this problem. If Number of Slices is higher than MaxNumberOfSlices then `ABCanalysis` is applied (see [Ultsch/Lotsch, 2015]) and group A chosen. If Number of Slices in group A is higher than MaxNumberOfSlices, then the most important ones out of group A are chosen. If MaxNumberOfSlices is higher than Slices in group A, additional slices are shown depending on the percentage (from high to low).

Color sequence is automatically shortened to the MaxNumberOfSlices used in the fan plot.

### Value

silent output by calling `invisible` of a list with

| | |
|---|---|
| `Percentages` | [1:k] percent values visualized in fanplot |
| `Labels` | [1:k] see input `Labels`, only relevant ones |

## Details

Stocks are selected by the German Prime standard accoridingly to the "Names" data frame. Fundamental Data with missing values is stored in "Data". The rownames of "Data" have the same Key as the first row of "Names" which is the trading symbol. "Cls" provides the clustering as a numerical vector of 1:k classes performed by Databionic Swarm in [Thrun, 2019].

---

`GoogleMapsCoordinates` *Google Maps with marked coordinates*

---

## Description

Google Maps with marked coordinates.

## Usage

```
GoogleMapsCoordinates(Longitude,Latitude,Cls=rep(1,length(Longitude)),
zoom=3,location= c(mean(Longitude),mean(Latitude)),stroke=1.7,size=6,sequence)
```

## Arguments

| | |
|---|---|
| `Longitude` | sphaerischer winkel der Kugeloberflaeche, coord 1 |
| `Latitude` | sphaerischer winkel der Kugeloberflaeche, coord 2 |
| `Cls` | Vorklassification/Clusterung |
| `zoom` | map zoom, an integer from 3 (continent) to 21 (building), default value 10 (city). openstreetmaps limits a zoom of 18, and the limit on stamen maps depends on the maptype. "auto" automatically determines the zoom for bounding box specifications, and is defaulted to 10 with center/zoom specifications. maps of the whole world currently not supported |
| `location` | Optional, default: c(mean(Longitude),mean(Latitude); an address, longitude/latitude pair (in that order), or left/bottom/right/top bounding box |
| `stroke` | Optional, plotting parameter, dicke der linien der coordiantensymbole |
| `size` | Optional, plotting parameter, groesse der koordinatensymbole |
| `sequence` | Optional, vector of length of number of clusers with numbers indicating the plotting symbols and colors to use |

## Details

This plot was used in [Thrun, 2018, p. 135].

## Value

ggobject()

## Note

requires an Internet connection, requires an API key of Google. See ?ggmap::register_google for details.

---

Heatmap *Heatmap for Clustering*

---

## Description

Heatmap of Distances of Data sorted by Cls. Clustering algorithms provide a Classifcation of data, where the labels are defined as a numeric vector `Cls`. Then, a typical cluster-respectively group structure is displayed by the `Heatmap` function. At the margin of the heatmap a dendrogram can be shown, if hierarchical cluster algorithms are used [Wilkinson,2009]. Here the dendrogram has to be shown separately and only the heatmap itself is displayed

## Usage

```
Heatmap(DataOrDistances,Cls,method='euclidean',

LowLim=0,HiLim,LineWidth=0.5,Clabel="Cluster No.")
```

## Arguments

`DataOrDistances`
: if not symmetric, then the function assumes a [1:n,1:d] numeric matrix of n data cases in rows amd d variables in columns. In this case, the distance metric specifed in `method` will be used.
  Otherwise,
  [1:n,1:n] distance matrix that is symmetric

`Cls`
: [1:n] numerical vector of numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers for k clusters that represent the arbitrary labels of the clustering, assuming a descending order of 1 to k. If not ordered please use `ClusterRenameDescendingSize`. Otherwise x and y label will be incorrect.

`method`
: Optional, if `DataOrDistances` is a [1:n,1:d] not symmetric numerical matrix, please see `parDist` for accessible distance methods, default is Euclidean

`LowLim`
: Optional: limits for the color axis

| | |
|---|---|
| `HiLim` | Optional: limits for the color axis |
| `LineWidth` | Width of lines seperating the clusters in the heatmap |
| `Clabel` | Default "`Cluster No.`", for large number of clusters abbrevations can be used like "`Cls No.`" or "`C`" in order to fit as the x and y axis labels |

## Details

"Cluster heatmaps are commonly used in biology and related fields to reveal hierarchical clusters in data matrices. Heatmaps visualize a data matrix by drawing a rectangular grid corresponding to rows and columns in the matrix and coloring the cells by their values in the data matrix. In their most basic form, heatmaps have been used for over a century [Wilkinson, 2012]. In addition to coloring cells, cluster heatmaps reorder the rows and/or columns of the matrix based on the results of hierarchical clustering. (...) . Cluster heatmaps have high data density, allowing them to compact large amounts of information into a small space [Weinstein, 2008]", [Engle, 2017].

The procedure can be adapted to distance matrices [Thrun, 2018]. Then, the color scale is chosen such that pixels of low distances have blue and teal colors, pixels of middle distances yellow colors, and pixels of high distances have orange and red colors [Thrun, 2018]. The distances are ordered by the clustering and the clusters are divided by black lines. A clustering is valid if the intra-cluster distances are distinctively smaller that inter-cluster distances in the heatmap [Thrun, 2018]. For another example, please see [Thrun, 2018] (Fig. 3.7, p. 31).

## Value

object of ggplot2

## See Also

`Pixelmatrix`

## Examples

```
data("Lsun3D")
Cls=Lsun3D$Cls
Data=Lsun3D$Data

#Data
Heatmap(Data,Cls = Cls)

#Distances
Heatmap(as.matrix(dist(Data)),Cls = Cls)
```

---

`HeatmapColors` *Default color sequence for plots*

---

## Description

Defines the default color sequence for plots made with PixelMatrixPlot

## Usage

```
data("HeatmapColors")
```

## Format

A vector with different strings describing colors for this plot.

---

`InspectBoxplots` *Inspect Boxplots*

---

## Description

Enables to inspect the boxplots for multiple variables in ggplot2 syntax. Each boxplot also has a point for the mean of the variable.

## Usage

```
InspectBoxplots(Data, Names,Means=TRUE)
```

## Arguments

| | |
|---|---|
| `Data` | Matrix containing the data. Each column is one variable. |
| `Names` | Optional: Names of the variables. If missing the columnnames of data are used. |
| `Means` | Optional: TRUE: with mean, FALSE: Only median. |

### Value

The ggplot object of the boxplots

### Author(s)

Felix Pape

### Examples

```
x <- cbind(A = rnorm(200, 1, 3), B = rnorm(100, -2, 5))
InspectBoxplots(x)
```

---

## InspectCorrelation *Inspect the Correlation*

---

### Description

Inspects the correlation between two given features using density scatter plots.

### Usage

```
InspectCorrelation(X, Y, DensityEstimation = "SDH",

CorMethod = "spearman", na.rm = TRUE,

SampleSize = round(sqrt(5e+08), -3),

NrOfContourLines = 20, Plotter = "native",

DrawTopView = T, xlab, ylab,

main = "Spearman correlation coef.:", xlim, ylim,

Legendlab_ggplot = "value", ...)
```

### Arguments

| | |
|---|---|
| X | Numeric vector [1:n], first feature (for x axis values) |
| Y | Numeric vector [1:n], second feature (for y axis values) |
| DensityEstimation | "SDH" is very fast but maybe not correct, "PDE" is slow but proably more correct. |
| CorMethod | method of correlation of the cor function, One of "pearson" (default), "kendall", or "spearman |
| SampleSize | Numeric, positiv scalar, maximum size of the sample used for calculation. High values increase runtime significantly. The default is that no sample is drawn |

| | |
|---|---|
| `na.rm` | Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| `NrOfContourLines` | Numeric, number of contour lines to be drawn. 20 by default. |
| `Plotter` | String, name of the plotting backend to use. Possible values are: `"native"`, `"ggplot"`, `"plotly"` |
| `DrawTopView` | Boolean, True means contur is drawn, otherwise a 3D plot is drawn. Default: TRUE |
| `xlab` | String, title of the x axis. Default: "X", see `plot()` function |
| `ylab` | String, title of the y axis. Default: "Y", see `plot()` function |
| `main` | string, the same as "main" in `plot()` function |
| `xlim` | see `plot()` function |
| `ylim` | see `plot()` function |
| `Legendlab_ggplot` | String, in case of `Plotter="ggplot"` label for the legend. Default: "value" |
| `...` | Density specifc parameters, for `PDEscatter()` or SDH (nbins,lambda,Xkernels,Ykernel)) |

## Details

Example shows that features with high correlation coefficient do not correlate because of bimodality.

## Value

plotting handler

DensityScatter

## Examples

```
data(ITS)
data(MTY)
Inds=which(ITS<900&MTY<8000)

InspectCorrelation(ITS[Inds],MTY[Inds])
```

`InspectDistances` *Inspection of Distance-Distribution*

## Description

Visualizes the distances between objects in the data matrix

## Usage

```
InspectDistances(DataOrDistances,method= "euclidean",sampleSize = 50000,...)
```

## Arguments

| | |
|---|---|
| `DataOrDistances` | [1:n,1:d] data cases in rows, variables in columns, if not symmetric<br>or<br>[1:n,1:n] distance matrix, if symmetric |
| `method` | Optional, if Data[1:n,1:d] see `parallelDist::parDist` for distance method |
| `sampleSize` | double value defining the size of the sample for large distance matrizes, see `InspectVariable` |
| `...` | further arguments passed on to `InspectVariable` |

## Details

For an interpretation of the distribution analysis of the distance please read [Thrun, 2018, p. 27, 185].

## Note

uses `InspectVariable`

## Author(s)

Michael Thrun

## References

[Thrun, 2018] Thrun, M. C.: Projection Based Clustering through Self-Organization and Swarm Intelligence, doctoral dissertation 2017, Springer, ISBN: 978-3-658-20539-3, Heidelberg, 2018.

## Examples

```
data("Lsun3D")
Data=Lsun3D$Data

InspectDistances(as.matrix(dist(Data)))
```

---

`InspectScatterplots` *Pairwise scatterplots and optimal histograms*

---

### Description

Pairwise scatterplots and optimal histograms of all features stored as columns of data are plotted

### Usage

```
InspectScatterplots(Data,Names=colnames(Data))
```

### Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] Data cases in rows (n), variables in columns (d) |
| `Names` | Optional: Names of the variables. If missing the columnnames of data are used. |

### Details

For two features, `PDEscatter` function should be used to isnpect modalities [Thrun/Ultsch, 2018]. For many features the function takes too lang. In such a case this function can be used. See [Thrun/Ultsch, 2018] for optimal histogram description.

InspectVariable *Visualization of Distribution of one variable*

## Description

Enables distribution inspection by visualization as described in [Thrun, 2018] and for example used in

## Usage

```
InspectVariable(Feature, Name, i = 1, xlim, ylim,

 sampleSize =1e+05, main)
```

## Arguments

| | |
|---|---|
| Feature | [1:n] Variable/Vector of Data to be plotted |
| Name | Optional, string, for x label |
| i | Optional, No. of variable/feature, an integer of the for lope |
| xlim | [2] Optional, range of x-axis for PDEplot and histogram |
| ylim | [2] Optional, range of y-axis, only for PDEplot |
| sampleSize | Optional, default(100000), sample size, if datavector is to big |
| main | string for the title if other than what is desribed in N |

data(ITS)
str(ITS)
```

---

`JitterUniqueValues` *Jitters Unique Values*

---

## Description

Jitters Unique Values for Visualizations

## Usage

```
JitterUniqueValues(Data, Npoints = 20,

min = 0.99999, max = 1.00001)
```

## Arguments

| | |
|---|---|
| Data | [1:n] vector of data |
| Npoints | number of jittered points generated from the m unique values of the datavector Data |
| min | minimum value of jittering |
| max | maximum value of jittering |

## Details

min and max are either multiplied or added to data depending on the range of values. If Npoints==2, then only two values per unique of Data is jittered otherwise additional values are generated.Npoints==1 does not jitter the values but gives the unique values back.

## Value

vector of DataJitter[1:(m+Npoints-1)] jittered values

## Author(s)

Michael Thrun

## See Also

used for example in `MDplot`

## Examples

```
data=c(rep(1,10),rep(0,10),rep(100,10))

JitterUniqueValues(data,Npoints=1)

JitterUniqueValues(data,Npoints=2)

DataJitter=JitterUniqueValues(data,Npoints=20)
```

---

`Lsun3D` *Lsun3D inspired by FCPS [Thrun/Ultsch, 2020] introduced in [Thrun, 2018]*

---

## Description

Clearly defined clusters, different variances. Detailed description of dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

## Usage

```
data("Lsun3D")
```

## Details

Size 404, Dimensions 3

Dataset defines discontinuites, where the clusters have different variances. Three main clusters, and four outliers (in cluster 4). For a more detailed description see [Thrun, 2018].

## Examples

```
data(Lsun3D)
str(Lsun3D)
Cls=Lsun3D$Cls
Data=Lsun3D$Data
```

---

`MAplot` *Minus versus Add plot*

---

## Description

Bland-Altman plot [Altman/Bland, 1983].

## Usage

```
MAplot(X,Y,islog=TRUE,LoA=FALSE,CI=FALSE,

densityplot=FALSE,main,xlab,ylab,

Cls,lwd=2,ylim=NULL,...)
```

## Arguments

| | |
|---|---|
| `X` | [1:n] numerical vector of a feature/variable |
| `Y` | [1:n] another numerical vector of a feature/variable |
| `islog` | Optional, TRUE: MAplot, FALSE: M=x-y versus a=0.5(x+y) |
| `LoA` | Optional, if TRUE: limits of agreement are plottet as lines if densityplot=FALSE |
| `CI` | Optional, if TRUE: confidence intervals for LoA, see [Stockl et al., 2004], if densityplot=FALSE |
| `densityplot` | Optional, FALSE: Scatterplot using `Classplot`, TRUE: density scatter plot with `DensityScatter` |
| `main` | Optional, see `plot` |
| `xlab` | Optional, see `plot` |
| `ylab` | Optional, see `plot` |
| `Cls` | Optional, prior Classification as a numeric vector. |

| | |
|---|---|
| lwd | Optional, if LoA=TRUE or CI=TRUE the width of the lines, otherwise input argument is ignored |
| ylim | Optional, default =NULL sets this parameter automatically, otherwise see Classplot. |
| ... | for example, ylim, Please see either Classplot in the mode Plotter="native", or DensityScatter for further arguments depending on densityplot, see also details |

## Details

Bland-Altman plot [Altman/Bland, 1983] for visual representation of genomic data or in order to decorrelate data.

"The limits of agreement (LoA) are defined as the mean difference +- 1.96 SD of differences. If these limits do not exceed the maximum allowed difference between methods (the differences within mean +- 1.96 SD are not clinically important), the two methods are considered to be in agreement and may be used interchangeably." cited as in URL. Please note, that the underlying assumption is the normal distribution of the differences. Input argument LoA=TRUE shows the mean of the difference in blue and +- 1.96 SD in green. Input argument CI=TRUE shows the mean of the difference in blue and the confidence intervall as red dashed lines similar to the cited URL.

In case of densityplot=FALSE, the function Classplot is always called with Plotter="native". Then, the input argument "Colors"" of points can only be set in Classplot if "Cls"" is given in this function, otherwise the points are always black. The input argument "Size"" sets the size of points in Classplot.

## Value

| | |
|---|---|
| MA | [1:n,2] Matrix of Minus component of two features and Add component of two features |
| Handle | see DensityScatter for output options, if densityplot=TRUE, otherwise NULL |
| Statistics | Named list of four element, each consisting of one value depending on input parameters LoA and CI, of this function. If not specifically set each list element is NULL. The elements are Mean_value - mean allowed difference, SD_value - standard deviation of difference, LoA_value - Limits of agreement=1.96*SD, CI_value - confidence intervall, i.e., maximum allowed difference |

### Examples

```
data("ITS")
data("MTY")
MAlist=MAplot(ITS,MTY)
```

---

MDplot *Mirrored Density plot (MD-plot)*

---

### Description

This function creates a MD-plot for each variable of the data matrix. The MD-plot is a visualization for a boxplot-like shape of the PDF published in [Thrun et al., 2020] with the default ordering by shape. It is an improvement of violin or so-called bean plots and posses advantages in comparison to the conventional well-known box plot [Thrun et al., 2020].

A complete guide about the MDplot can be found in https://md-plot.readthedocs.io/en/latest/index.html.

### Usage

```
MDplot(Data, Names, Ordering='Default', Scaling="None",

Fill='darkblue', RobustGaussian=TRUE, GaussianColor='magenta',

Gaussian_lwd=1.5, BoxPlot=FALSE,BoxColor='darkred',

MDscaling='width', LineColor='black', LineSize=0.01,

QuantityThreshold=50, UniqueValuesThreshold=12,

SampleSize=5e+05,SizeOfJitteredPoints=1,OnlyPlotOutput=TRUE,

main="MD-plot",ylab="Range of values in which PDE is estimated",

BW=FALSE,ForceNames=FALSE)
```

### Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] Numerical Matrix containing the n cases of d variables. Each column is one variable. A data.frame is automatically transformed to a numerical matrix. |
| `Names` | Optional: [1:d] Names of the variables. If missing, the columnnames of data are used. If not missing, than the names can be cleaned or not (see `ForceNames`). |
| `Ordering` | Optional: string, either `Default`, `Columnwise` or `AsIs`, `Alphabetical`, `Average`, `Bimodal`, `Variance` or `Statistics`. Please see details for explanation. |
| `Scaling` | Optional, Default is `None`, `Percentalize`, `CompleteRobust`, `Robust` or `Log`, Please see details for explanation. |

Fill
: Optional: String or Vector, which gives the color(s) with which MDs are to be filled with.

RobustGaussian
: Optional: If TRUE: each MDplot of a variable is overlayed with a roubustly estimated unimodal Gaussian distribution in the range of this variable, if statistical testing does not yield a significant p.value. In this case the packages **moments**, **diptest** and **signal** are required.

GaussianColor
: Optional: string, color of robustly estimated gaussian, only for `RobustGaussian=TRUE`.

Gaussian_lwd
: Optional: numerical, line width of robustly estimated gaussian, only for `RobustGaussian=TRUE`.

BoxPlot
: Optional: If TRUE: each MDplot is overlayed with a Box-Whisker Diagram.

BoxColor
: Optional: string, color of Boxplot, only for `BoxPlot=TRUE`.

MDscaling
: Optional: if "area", all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width" (default), all MDs have the same maximum width.

LineColor
: Optional: string, color of line around the mirrored densities. `NA` disables this features which is usefull if ones wants to avoid vertical lines leading to outliers.

LineSize
: Optional: numerical, linewidth of line around the mirrored densities.

QuantityThreshold
: Optional: numeric value defining the threshold of the minimal amount of values in data. Below this threshold no density estimation is performed and a 1D scatter plot with jittered points is drawn. Only Data Science experts should change this value after they understand how the density is estimated (see [Ultsch, 2005]).

UniqueValuesThreshold
: Optional: numeric value defining the threshold of the minimal amount of unique values in data. Below this threshold no density estimation and statistical testing is performed and a 1D scatter plot with jittered points drawn. Only Data Science experts should change this value after they understand how the density is estimated (see [Ultsch, 2005]).

SampleSize
: Optional: numeric value defining a threshold. Above this threshold uniform sampling of finite cases is performed in order to shorten computation time.If **rowr** is not installed, uniform sampling of all cases is performed. If required, `SampleSize=n` can be set to omit this procedure.

SizeOfJitteredPoints
: Optional: scalar. If not enough unique values for density estimation are given, data points are jittered. This parameter defines the size of the points.

OnlyPlotOutput
: Optional: Default TRUE only a ggplot object is given back, if FALSE: Additinally, scaled data and ordering are the output of this function in a `list`.

main
: string defining the (centered) title of the plot

ylab
: string defining the y label, PDE= pareto density estimation (see [Ultsch, 2005])

BW
: FALSE: usual ggplot2 background and style which is good for screen visualizations

  TRUE: theme_bw() is used which is more appropriate for publications

ForceNames
: FALSE: Per Default column names are cleaned for propper plotting

  TRUE: forces to set the column names as given. Beware, this can result in plotting errors.

## Details

In short, the MD-plot can be described as a PDE optimized violin plot. The Pareto Density Estimation (PDE) is an approach to estimate the probability density function (pdf) [Ultsch, 2005].

The MD-plot is in the process of beeing peer-reviewed [Thrun/Ultsch, 2019].

Statistical testing is performed with `dip.test` and `agostino.test`.

For the paramter `Ordering` the following options are possible:

`Default` Ordering of plots by convex/concav/unimodal/nonunimodal shapes using statistical criteria. In this case the **signal** is required.

`Columnwise` Ordering of plots by the order of columns of `Data`.

`AsIs` Synonym of Columnwise: Ordering of plots by the order of columns of `Data`.

`Alphabetical` Ordering of plots by the order of columns of `Data` sorted in alphabetical order by column names.

`Average` Ordering of plots by the order of columns of `Data` sorted in order of increasing columnwise average

`Bimodal` Ordering of plots by the order of columns of `Data` sorted in order of decreasing bimodality amplitude[Zhang et al., 2003]

`Variance` Ordering of plots by the order of columns of `Data` sorted in order of increasing interquartile range

`Statistics` Ordering of plots depending on the logarithm of the p-vlaues of statistical testing. In this case the packages **moments**, **diptest** and **signal** are required.

For the paramter `Scaling` the following options are possible:

`None` No Scaling of data is done.

`Percentalize` Data is scaled between zero and 100.

`CompleteRobust` Data is first robustly scaled between zero and 1, then centered to zero and outliers are capped by a robustly formula described in `RobustNormalization`.

`Robust` Data is robustly scaled between zero and 1 by a formula described in the `RobustNormalization`.

`Log` Data is transformed with a sgined log allowing for negative values to be transformed with a logarithm of base 10, please see `SignedLog` for details.

## Value

In the default case of `OnlyPlotOutput==TRUE`: The ggplot object of the MD-plot.

Otherwise for `OnlyPlotOutput==FALSE`: A list of

`ggplotObj` The ggplot object of the MD-plot.

`Ordering` The ordering of columns of data defined by `Ordering`.

`DataOrdered` [1:n,1:d] matrix of ordered and scaled data defined by `Ordering` and `Scaling`.

Note that the package **ggExtra** is not necessarily required but if given the feature names are automatically rotated.

## Note

1.) One would assume that in the first of the two following cases ggplot2 only adjusts the plotting region but:

`MDplot(MTY)+ylim(c(0,7000))` is equal to `MDplot(MTY[MTY<7000])`.

This means in both cases the data is clipped and AFTERWARDS the density estimation is performed.

2.) Because of a (sometimes) strange behavior of either ggplot2 or reshape2, numerical column names are changed to character by adding 'C_' which can disabled using `ForceNames=TRUE`.

3.) Columnnames will be automatically deblanked and cleaned. To force specific columnnames the input `Names` can be used in combination with `ForceNames=TRUE`. However, this can result in plotting errors or other strange behavior.

4.) Overlaying MD-plots with robustly estimated gaussians seldomly will yield magenta (or other `GaussianColor`) lines overlaying more than the violin plot they should overlay, because the width of the two plots is not the same (but I am unable to set it strictly in ggplot). In such a case just call the function again.

## Author(s)

Michael Thrun, Felix Pape contributed with the idea to use ggplot2 as the basic framework.

## Examples

```
x = cbind(
    A = runif(2000, 1, 5),
    B = c(rnorm(1000, 0, 1), rnorm(1000, 2.6, 1)),
    C = c(rnorm(2000, 2.5, 1)),
    D = rpois(2000, 5)
  )
MDplot(x)
```

MDplot4multiplevectors

*Mirrored Density plot (MD-plot)for Multiple Vectors*

## Description

This function creates a MD-plot for multiple numerical vectors of various lenghts. The MD-plot is a visualization for a boxplot-like Shape of the PDF published in [Thrun et al., 2020]. It is an improvement of violin or so-called bean plots and posses advantages in comparison to the conventional well-known box plot [Thrun et al., 2020].

## Usage

```
MDplot4multiplevectors(..., Names, Ordering = 'Columnwise',
Scaling = "None", Fill = 'darkblue', RobustGaussian = TRUE,

GaussianColor = 'magenta', Gaussian_lwd = 1.5, BoxPlot = FALSE,

BoxColor = 'darkred', MDscaling = 'width', LineSize = 0.01,

LineColor = 'black', QuantityThreshold = 40, UniqueValuesThreshold = 12,

SampleSize = 5e+05, SizeOfJitteredPoints = 1, OnlyPlotOutput = TRUE)
```

## Arguments

| | |
|---|---|
| `...` | Either d numerical vectors of different lengths or a list of length d where each element of the list is an vector of arbitrary length |
| `Names` | Optional: [1:d] Names of the variables. If missing, the columnnames of data are used. |
| `Ordering` | Optional: string, either `Default`, `Columnwise`, `Alphabetical` or `Statistics`. Please see details for explanation. |
| `Scaling` | Optional, Default is `None`, `Percentalize`, `CompleteRobust`, `Robust` or `Log`, Please see details for explanation. |
| `Fill` | Optional: string, color with which MDs are to be filled with. |
| `RobustGaussian` | Optional: If TRUE: each MDplot of a variable is overlayed with a roubustly estimated unimodal Gaussian distribution in the range of this variable, if statistical testing does not yield a significant p.value. In this case the packages **moments**, **diptest** and **signal** are required. |
| `GaussianColor` | Optional: string, color of robustly estimated gaussian, only for `RobustGaussian=TRUE`. |
| `Gaussian_lwd` | Optional: numerical, line width of robustly estimated gaussian, only for `RobustGaussian=TRUE`. |
| `BoxPlot` | Optional: If TRUE: each MDplot is overlayed with a Box-Whisker Diagram. |

| | |
|---|---|
| BoxColor | Optional: string, color of Boxplot, only for BoxPlot=TRUE. |
| MDscaling | Optional: if "area", all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width" (default), all MDs have the same maximum width. |
| LineSize | Optional: numerical, linewidth of line around the mirrored densities. |
| LineColor | Optional: string, color of line around the mirrored densities. NA disables this features which is usefull if ones wants to avoid vertical lines leading to outliers. |
| QuantityThreshold | Optional: numeric value defining a threshold. Below this threshold no density estimation is performed and a jitter plot with a median line is drawn. Only Data Science experts should change this value after they understand how the density is estimated (see [Ultsch, 2005]). |
| UniqueValuesThreshold | Optional: numeric value defining a threshold. Below this threshold no density estimation and statistical testing is performed and a Jitter plot is drawn. Only Data Science experts should change this value after they understand how the density is estimated (see [Ultsch, 2005]). |
| SampleSize | Optional: numeric value defining a threshold. Above this threshold uniform sampling of finite cases is performed in order to shorten computation time.If **rowr** is not installed, uniform sampling of all cases is performed. If required, SampleSize=n can be set to omit this procedure. |
| SizeOfJitteredPoints | Optional: scalar. If Not enough unique values for density estimation are given, data points are jittered. This parameter defines the size of the points. |
| OnlyPlotOutput | Optional: Default TRUE only a ggplot object is given back, if FALSE: Additinally Scaled Data and ordering are the output of this function in a list. |

## Details

Please see MDplot for details.

## Value

In the default case of OnlyPlotOutput==TRUE: The ggplot object of the MD-plot.

Otherwise for OnlyPlotOutput==FALSE: A list of

| | |
|---|---|
| ggplotObj | The ggplot object of the MD-plot. |
| Ordering | The ordering of columns of data defined by Ordering. |
| DataOrdered | [1:n,1:d] matrix of ordered and scaled data defined by Ordering and Scaling. |

Note that the package **ggExtra** is not necessarily required but if given the feauture names are automatically rotated.

## Note

cbind.fill is internally used from the depricated R package rowr of Craig Varrichio.

## Multiplot — *Plot multiple ggplots objects in one panel*

---

### Description

ggplot objects can be passed in ..., or to plotlist (as a list of ggplot objects)
For example, if the layout is specified as the matrix(c(1,2,3,3), nrow=2, byrow=TRUE), then plot 1 will go in the upper left, 2 will go in the upper right, and 3 will go all the way across the bottom.

### Usage

```
Multiplot(..., Plotlist=NULL, ColNo=1, LayoutMat)
```

### Arguments

| | |
|---|---|
| `...` | multiple ggplot objects to be plotted |
| `Plotlist` | Optional: list filled with ggplot objects to be plotted |
| `ColNo` | Number of columns in layout |
| `LayoutMat` | A matrix specifying the layout. If present, 'ColNo' is ignored. |

### Value

List with Plotlist

### Author(s)

Winston Chang

## Examples

```
data(Lsun3D)
Data=Lsun3D$Data
Cls=Lsun3D$Cls
obj1=Classplot(Data[,1],Data[,2],Cls=Cls,Plotter="ggplot",Size=3,main="Top plot")
obj2=Classplot(Data[,2],Data[,3],Cls=Cls,Plotter="ggplot",Size=3,main="Middle plot")
obj3=Classplot(Data[,1],Data[,3],Cls=Cls,Plotter="ggplot",Size=3,main="Bottom plot")
V=Multiplot(obj1,obj2,obj3)
```

---

# `OptimalNoBins` *Optimal Number Of Bins*

---

## Description

Optimal Number Of Bins is a kernel density estimation for fixed intervals.

Calculation of the optimal number of bins for a histogram.

## Usage

```
OptimalNoBins(Data)
```

## Arguments

| | |
|---|---|
| `Data` | Data |

## Details

The bin width ist defined with bw=3.49*stdrobust(1/(n)^1/3)

## Value

optNrOfBins The best possible number of bins. Not less than 10 though

## Note

This the second version of the function prior available in **AdaptGauss**

### Examples

```
Data = c(rnorm(1000),rnorm(2000)+2,rnorm(1000)*2-1)

optNrOfBins = OptimalNoBins(Data)

minData = min(Data,na.rm = TRUE)

maxData = max(Data,na.rm = TRUE)

i = maxData-minData

optBreaks = seq(minData, maxData, i/optNrOfBins) # bins in fixed intervals

hist(Data, breaks=optBreaks)
```

---

ParetoDensityEstimation
*Pareto Density Estimation V3*

---

### Description

This function estimates the Pareto Density for the distribution of one variable. In the default setting the functions estimates internally the appropriate number and position of kernels to estimate the density properly. However, the user can set the `kernels` manually. In this case density will only be estimated only around these values even if data exists outside the range of kernels or the internally estimated `paretoRadius` does not contain all datapoints between each kernel. See example for details.

### Usage

```
ParetoDensityEstimation(Data, paretoRadius, kernels = NULL,
  MinAnzKernels = 100,PlotIt=FALSE,Silent=FALSE)
```

### Arguments

| | |
|---|---|
| `Data` | [1:n] numeric vector of data. |
| `paretoRadius` | Optional scalar, numeric value, see `ParetoRadius`.If not given it is estimated internally. Please do not set manually |
| `kernels` | Optional,[1:m] numeric vector data values where pareto density is measured at. If 0 (by default) kernels will be computed. |
| `MinAnzKernels` | Optional, minimal number of kernels, default MinAnzKernels==100 |
| `PlotIt` | Optional, if TRUE: raw basic r plot of density estimation of debugging purposes. Usually please use **ggplot2** interface via `PDEplot` or `MDplot` |
| `Silent` | Optional, if TRUE: disables all warnings |

## Details

Pareto Density Estimation (PDE) is a method for the estimation of probability density functions using hyperspheres. The Pareto-radius of the hyperspheres is derived from the optimization of information for minimal set size. It is shown, that Pareto Density is the best estimate for clusters of Gaussian structure. The method is shown to be robust when cluster overlap and when the variances differ across clusters. This is the best density estimation to judge Gaussian Mixtures of the data see [Ultsch 2003].

If input argument `kernels` is set manually the output arguments `paretoDensity_internal` and `kernels_internal` provide the internally estimated density and kernels. Otherwise these arguments are NULL. The function provides a message if range of kernels and range of data does not overlap completly.

Typically it is not advisable to set `paretoRadius` manually. However in specific cases, the function `ParetoRadius` is used prior to calling this function. In such cases the input argument can use a priorly estimated `paretoRadius`.

## Value

List With

**kernels** [1:m] numeric vector. data values at with Pareto Density is measured.

**paretoDensity** [1:m] numeric vector containing the determined density by `paretoRadius`.

**paretoRadius** numeric value of defining the radius

**kernels_internal** Either NULL or internally estimated [1:p] numeric vector of kernels if input argument `kernels` was set by the user

**paretoDensity_internal** Either NULL or internally estimated density if input argument `kernels` was set by the user

## Note

This the second version of the function prior available in **AdaptGauss**

## Examples

```
#kernels are estimated internally
data = c(rnorm(1000),rnorm(2000)+2,rnorm(1000)*2-1)
pdeVal        <- ParetoDensityEstimation(data)
plot(pdeVal$kernels,pdeVal$paretoDensity,type='l',xaxs='i',
yaxs='i',xlab='Data',ylab='PDE')

##data exist outside of the range kernels
kernels=seq(from=-3,to=3,by=0.01)
pdeVal        <- ParetoDensityEstimation(data,  kernels=kernels)
plot(pdeVal$kernels,pdeVal$paretoDensity,type='l',xaxs='i',
yaxs='i',xlab='Data',ylab='PDE')

#data exists in-between kernels that is not measured
pdeVal$paretoRadius#0.42
kernels=seq(from=-8,to=8,by=1)
pdeVal        <- ParetoDensityEstimation(data,  kernels=kernels)
plot(pdeVal$kernels,pdeVal$paretoDensity,type='l',xaxs='i',
yaxs='i',xlab='Data',ylab='PDE')
```

---

`ParetoRadius` *ParetoRadius for distributions*

---

## Description

Calculation of the ParetoRadius i.e. the 18 percentiles of all mutual Euclidian distances in data.

## Usage

```
ParetoRadius(Data, maximumNrSamples = 10000,
  plotDistancePercentiles = FALSE)
```

## Arguments

`Data` numeric data vector

`maximumNrSamples`
Optional, numeric. Maximum number for which the distance calculation can be done. 1000 by default.

`plotDistancePercentiles`
Optional, logical. If TRUE, a plot of the percentiles of distances is produced. FALSE by default.

## Details

The Pareto-radius of the hyperspheres is derived from the optimization of information for minimal set size. ParetoRadius() is a kernel density estimation for variable intervals. It works only on Data without missing values (NA) or NaN. In other cases, please use ParetoDensityEstimation directly.

## Value

numeric value, the Pareto radius.

## Note

This the second version of the function prior available in **AdaptGauss**.

For larger datasets the quantile_c() function is used instead of quantile in R which was programmed by Dirk Eddelbuettel on Jun 6 and taken by the author from `https://github.com/RcppCore/Rcpp/issues/967`.

---

`PDEplot` *PDE plot*

---

## Description

This function plots the Pareto probability density estimation (PDE), uses PDEstimationForGauss and ParetoRadius.

## Usage

```
PDEplot(Data, paretoRadius = 0, weight = 1, kernels = NULL,

                 LogPlot = F, PlotIt = TRUE, title =
                 "ParetoDensityEstimation(PDE)", color = "blue",

                 xpoints = FALSE, xlim, ylim, xlab, ylab =
                 "PDE", ggPlot = ggplot(), sampleSize = 2e+05, lwd = 2)
```

## Arguments

| | |
|---|---|
| Data | [1:n] numeric vector of data to be plotted. |
| paretoRadius | numeric, the Pareto Radius. If omitted, calculate by paretoRad. |
| weight | numeric, Weight*ParetoDensity is plotted. 1 by default. |
| kernels | numeric vector of kernels. Optional |
| LogPlot | LogLog PDEplot if TRUE, xpoints has to be FALSE. Optional |
| PlotIt | logical, if plot. TRUE by default. |
| title | character vector, title of plot. |
| color | character vector, color of plot. |
| xpoints | logical, if TRUE only points are plotted. FALSE by default. |
| xlim | Arguments to be passed to the plot method. |
| ylim | Arguments to be passed to the plot method. |
| xlab | Arguments to be passed to the plot method. |
| ylab | Arguments to be passed to the plot method. |
| ggPlot | ggplot2 object to be plotted upon. Insert an exisiting plot to add a new PDEPlot to it. Default: empty plot |
| sampleSize | default(200000), sample size, if datavector is to big |
| lwd | linewidth, see `plot` |

## Value

| | |
|---|---|
| kernels | numeric vector. The x points of the PDE function. |
| paretoDensity | numeric vector, the PDE(x). |
| paretoRadius | numeric value, the Pareto Radius used for the plot. |
| ggPlot | ggplot2 object. Can be used to further modify the plot or add other plots. |

#     ggplotObj=PDEplot(Data[,i],ggPlot = ggplotObj)$ggPlot
```

---

## Piechart *The pie chart*

---

### Description

the pie chart represents amount of values given in data.

### Usage

```
Piechart(Datavector,Names,Labels,MaxNumberOfSlices,
main='',col,Rline=1,...)
```

### Arguments

| | |
|---|---|
| `Datavector` | [1:n] a vector of n non unique values |
| `Names` | Optional, [1:k] names to search for in Datavector, if not set `unique` of Datavector is calculated. |
| `Labels` | Optional, [1:k] Labels if they are specially named, if not Names are used. |
| `MaxNumberOfSlices` | Default is k, integer value defining how many labels will be shown. Everything else will be summed up to `Other`. |
| `main` | Optional, title below the fan pie, see `plot` |
| `col` | Optional, the default are the first [1:k] colors of the default color sequence used in this package, otherwise a character vector of [1:k] specifying the colors analog to `plot` |
| `Rline` | Optional, the radius of the pie in numerical numbers |
| `...` | Optional, further arguments passed on to `plot` |

### Details

If Number of Slices is higher than MaxNumberOfSlices then `ABCanalysis` is applied (see [Ultsch/Lotsch, 2015]) and group A chosen. If Number of Slices in group A is higher than MaxNumberOfSlices, then the most important ones out of group A are chosen. If MaxNumberOfSlices is higher than Slices in group A, additional slices are shown depending on the percentage (from high to low). Parameters of visualization a set as in [Schwabish, 2014] defined.

Color sequence is automatically shortened to the MaxNumberOfSlices used in the pie chart.

## Value

silent output by calling `invisible` of a list with

| | |
|---|---|
| `Percentages` | [1:k] percent values visualized in fanplot |
| `Labels` | [1:k] see input `Labels`, only relevant ones |

## Note

You see in the example below that a pie chart does not visualize such data well contrary to the `fanPlot`.

## Examples

```
data(categoricalVariable)
Piechart(categoricalVariable)
```

---

`Pixelmatrix` *Plot of a Pixel Matrix*

---

## Description

Plots Data matrix as a pixel coulour image.

## Usage

```
Pixelmatrix(Data, XNames, LowLim, HiLim,

YNames, main,FillNotFiniteWithHighestValue=FALSE)
```

## Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] Data cases in rows (n), variables in columns (d) |
| `LowLim` | Optional: limits for the color axis |
| `HiLim` | Optional: limits for the color axis |
| `XNames` | Optional: Vector - names for the X-ticks, NULL: no ticks at all |
| `YNames` | Optional: Vector - names for the Y-ticks, NULL: no ticks at all |
| `main` | Optoinal: String - Title of the plot |
| `FillNotFiniteWithHighestValue` | Optional: TRUE: fills not finite values with same color as the highest value |

## Details

Low values are shown in blue and green, middle values in yellow and high values in orange and red.

## Author(s)

Michael Thrun, Felix Pape

## Examples

```
data("Lsun3D")
Data=Lsun3D$Data

Pixelmatrix(Data)
```

---

`Plot3D` *3D plot of points*

---

## Description

A wrapper for Data with systematic clustering colors for either a 2D (x,y) or 3D (x,y,z) plot combined with a classification

## Usage

```
Plot3D(Data,Cls,UniqueColors,

size=2,na.rm=FALSE,Plotter3D="rgl",...)
```

## Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] matrix with either d=2 or d=3, if d>3 only the first 3 dimensions are taken |
| `Cls` | [1:n] numeric vector of the classification of data with k classes |
| `UniqueColors` | [1:k] character vector of colors, if not given DataVisualizations::DefaultColorSequence is used |
| `size` | size of points, for plotly additional a vector [1:n] of a mapping of sizes to Cls has to be given in the (...) argument with `sizes=` |
| `na.rm` | if `na.rm=TRUE`, then missing values are removed |
| `Plotter3D` | in case of 3 dimensions, choose either "plotly" or "rgl",<br>if one of this packages is not given, the other one is selected as a fallback method |
| `...` | further arguments to be processed by `plot3d` or `geom_point` or `plot_ly` of type "scatter3d" |

## Details

For `geom_point` only `size` and `na.rm` is available as further arguments.

## Note

Uses either `geom_point` for 2D or `plot3d` for 3D or `plot_ly`

## Author(s)

Michael Thrun

## References

RGL vignette in https://cran.r-project.org/package=rgl

## Examples

```
#Spin3D similar output

data(Lsun3D)
Plot3D(Lsun3D$Data,Lsun3D$Cls,type='s',radius=0.1,box=FALSE,aspect=TRUE)
rgl::grid3d(c("x", "y", "z"))

#Projected Points with Classification
Data=cbind(runif(500,min=-3,max=3),rnorm(500))

# Classification
Cls=ifelse(Data[,1]>0,1,2)
Plot3D(Data,Cls,UniqueColors = DataVisualizations::DefaultColorSequence[c(1,3)],size=2)

## Not run:
#Points with Non-Overlapping Labels
```

```
#require(ggrepel)
Data=cbind(runif(30,min=-1,max=1),rnorm(30,0,0.5))
Names=paste0('VeryLongName',1:30)
ggobj=Plot3D(Data)
ggobj +  geom_text_repel(aes(label=Names), size=3)

## End(Not run)
```

---

PlotGraph2D *PlotGraph2D*

---

## Description

plots a neighborhood graph in two dimensions given the 2D coordinates of the points

## Usage

```
PlotGraph2D(AdjacencyMatrix, Points, Cls, Colors, xlab = "X", ylab = "Y", xlim,
ylim, Plotter = "native", LineColor = "grey", pch = 20, lwd = 0.1, main = "",
mainSize)
```

## Arguments

| | |
|---|---|
| AdjacencyMatrix | [1:n,1:n] numerical matrix consting of binary values. 1 indicates that two points have an edge, zero that they do not |
| Points | [1:n,1:2] numeric matrix of two feature |
| Cls | [1:n] numeric vector of k classes, if not set per default every point is in first class |
| Colors | Optional, string defining the k colors, one per class |
| xlab | Optional, string for xlabel |
| ylab | Optional, string for ylabel |
| xlim | Optional, [1:2] vector of x-axis limits |
| ylim | Optional, [1:2] vector of y-axis limits |
| Plotter | Optional, either "native" or "plotly" |
| LineColor | Optional, color of edges |
| pch | Optional, shape of point, usally can be in a range from zero to 25, see pch of plot for details |
| lwd | width of the lines |
| main | Optional, string for the title of plot |
| mainSize | Optional, scalar for the size of the title of plot |

## Details

The points are the vertices of the graph. the adjacency matrix defines the edges. Via adjacency matrix various graphs, like from deldir package, can be used.

### Value

native plot or plotly object depending on input argument `Plotter`

### Author(s)

Michael Thrun

### References

Lecture of Knowledge Discovery II

`pch`

### Examples

```
N=10
x=runif(N)
y=runif(N)
Euklid=as.matrix(dist(cbind(x,y)))
Radius=quantile(as.vector(Euklid),0.5)
RKugelGraphAdjMatrix = matrix(0, ncol = N, nrow = N)
for (i in 1:N) {
  RInd = which(Euklid[i, ] <= Radius, arr.ind = TRUE)
  RKugelGraphAdjMatrix[i, RInd] = 1
}
PlotGraph2D(RKugelGraphAdjMatrix,cbind(x,y))
```

---

## PlotMissingvalues *Plot of the Amount Of Missing Values*

---

### Description

Percentage of missing values per feature are visualized as a bar plot.

### Usage

```
PlotMissingvalues(Data,Names,

WhichDefineMissing=c('NA','NaN','DUMMY','.',' '),

PlotIt=TRUE,

xlab='Amount Of Missing Values in Percent',

xlim=c(0,100),...)
```

### Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] data cases in rows, variables/features in columns |
| `Names` | [1:d] optional vector of string describing the names of the features |
| `WhichDefineMissing` | [1:d] optional vector of string describing missing values, usefull for character features. Currently up to five different options are possible. |
| `PlotIt` | If FALES: Does not plot |
| `xlab` | x label of bar plot |
| `xlim` | x axis limits in percent |
| `...` | Further arguments passed on to `barplot`, such as `main` for title |

### Value

plots not finite and missing values as a bar plot for each feature d and returns with `invisible` the amount of missing values as a vector. Works even with character variables, but WhichDefineMissing cannot be changed at the current version. Please make a suggestion on GitHub how to improve this.

### Note

Does not work with the tibble format, in such a case please call `as.data.frame(as.matrix(Data))`

### Author(s)

Michael Thrun

### Examples

```
data("ITS")
data("MTY")

PlotMissingvalues(cbind(ITS,MTY),Names=c('ITS','MTY'))
```

---

## `PlotProductratio` *Product-Ratio Plot*

---

### Description

The product-ratio plot as defined in [Tukey, 1977, p. 594].

### Usage

```
PlotProductratio(X, Y, na.rm = FALSE,

main='Product Ratio Analysis',xlab = "Log of Ratio",ylab = "Root of Product", ...)
```

### Arguments

| | |
|---|---|
| `X` | [1:n] positive numerical vector, negativ values are removed automatically |
| `Y` | [1:n] positive numerical vector, negativ values are removed automatically |
| `na.rm` | Function may not work with non finite values. If these cases should be automatically removed, set parameter TRUE |
| `main` | see `plot` |
| `ylab` | see `plot` |
| `xlab` | see `plot` |
| `...` | further arguments passed on to `plot` |

### Details

In the case where there are many instances of very small values, but a small number of very large ones, this plot is usefull [Tukey, 1977, p. 615].

### Value

matrix[1:n,2] with sqrt(x*y) and log(x/y) as the two columns

### Author(s)

Michael Thrun

### References

[Tukey, 1977] Tukey, J. W.: Exploratory data analysis, United States Addison-Wesley Publishing Company, ISBN: 0-201-07616-0, 1977.

### Examples

```
#Beware: The data does no fit ne requirements for this approach
data('ITS')
data(MTY)
PlotProductratio(ITS,MTY)
```

---

## `PmatrixColormap` *P-Matrix colors*

---

### Description

Defines the default color sequence for plots made with PDEscatter

### Usage

```
data("PmatrixColormap")
```

## Format

Returns the vectors for a (heat) colormap.

---

QQplot *QQplot with a Linear Fit*

---

## Description

Qantile-quantile plot with a linear fit

## Usage

```
QQplot(X,Y,Type=8,NoQuantiles=10000,xlab, ylab,col="red",main='',
lwd=3,pch=20,subplot=FALSE,...)
```

## Arguments

| | |
|---|---|
| `X` | [1:n] numerical vector, First Feature |
| `Y` | 1:n] numerical vector, Second Feature to compare first feature with |
| `Type` | an integer between 1 and 9 selecting one of the nine quantile algorithms detailed in `quantile` |
| `NoQuantiles` | number of quantiles used in QQ-plot, if number is low and the data has outliers, there may be empty space visible in the plot |
| `xlab` | x label, see `plot` ... |
| `ylab` | y label, see `plot` |
| `col` | color of line, see `plot` |
| `main` | title of plot, see `plot` |
| `lwd` | line width of plot, see `plot` |
| `pch` | type of point, see `plot` |
| `subplot` | FALSE: par is set specifically, TRUE: assumption is the usage as a subfigure, par has to be set by the user, no checks are performed, labels have to be set by the user |
| `...` | other parameters for `qqplot` |

## Details

Output is the evaluation of a linear (regression) fit of `lm` called 'line' and a quantile quantile plot (QQplot). Per default 10.000 quantiles are chosen, but in the case of very large data vectors one can reduce the quantiles for faster computation. The 100 percentiles used for the regression line are of darker blue than the quantiles chosen by the user.

## Value

List with

| | |
|---|---|
| `Quantiles` | [1:NoQuantiles,1:2] quantiles in y and y |
| `Residuals` | Output of the Regression with `residuals.lm(line)` |
| `Summary` | Output of the Regression with `summaryline)` |
| `Anova` | Output of the Regression with `anova(line)` |

## Examples

```
data(MTY)
NormalDistribution=rnorm(50000)
QQplot(NormalDistribution,MTY)
```

---

# `RobustNormalization` *RobustNormalization*

---

## Description

RobustNormalization as described in [Milligan/Cooper, 1988].

## Usage

```
RobustNormalization(Data,Centered=FALSE,Capped=FALSE,

na.rm=TRUE,WithBackTransformation=FALSE,

pmin=0.01,pmax=0.99)
```

## Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] data matrix of n cases and d features |
| `Centered` | centered data around zero by median if TRUE |
| `Capped` | TRUE: outliers are capped above 1 or below -1 and set to 1 or -1. |
| `na.rm` | If TRUE, infinite vlaues are disregarded |
| `WithBackTransformation` | If in the case for forecasting with neural networks a backtransformation is required, this parameter can be set to 'TRUE'. |
| `pmin` | defines outliers on the lower end of scale |
| `pmax` | defines outliers on the higher end of scale |

## Details

Normalizes features either between -1 to 1 (Centered=TRUE) or 0-1 (Centered=TRUE) without changing the distribution of a feature itself. For a more precise description please read [Thrun, 2018, p.17].

"[The] scaling of the inputs determines the effective scaling of the weights in the last layer of a MLP with BP neural netowrk, it can have a large effect on the quality of the final solution. At the outset it is best to standardize all inputs to have mean zero and standard deviation 1 [(or at least the range under 1)]. This ensures all inputs are treated equally in the regularization prozess, and allows to choose a meaningful range for the random starting weights."[Friedman et al., 2012]

## Value

if `WithBackTransformation=FALSE`: TransformedData[1:n,1:d] i.e., normalized data matrix of n cases and d features

if `WithBackTransformation=TRUE`: List with

`TransformedData`
: [1:n,1:d] normalized data matrix of n cases and d features

`MinX`
: [1:d] numerical vector used for manual back-transformation of each feature

`MaxX`
: [1:d] numerical vector used for manual back-transformation of each feature

`Denom`
: [1:d] numerical vector used for manual back-transformation of each feature

`Center`
: [1:d] numerical vector used for manual back-transformation of each feature

                                  TransList$Center)

sum(Lsun3DData - Data) #<e-15
```

---

ROC *ROC plot*

---

## Description

ROC

## Usage

```
ROC(Data, Cls, Names, Colors)
```

## Arguments

| | |
|---|---|
| Data | [1:n, 1:d] numeric vector or matrix of scores to be evaluated with ROC. |
| Cls | [1:n] numeric vector with true classes. |
| Names | [1:d] character vector with names for scores. |
| Colors | [1:d] character vector with colores for scores. |

## Value

| | |
|---|---|
| ROCit | List of ROCit results for each score column in Data. |
| Plot | Plotly object. |

## Author(s)

Quirin Stier

## Examples

```
Data = runif(1000,0,1)
Cls  = sample(c(0,1), 1000, replace = TRUE)
ROC(Data, Cls)
```

## ShepardDensityscatter *Shepard PDE scatter*

### Description

Draws ein Shepard Diagram (scatterplot of distances) with an two-dimensional PDE density estimation .

### Usage

```
ShepardDensityScatter(InputDists, OutputDists, Plotter= "native", Type = "DDCAL",
DensityEstimation="SDH", Marginals = FALSE, xlab='Input Distances',
ylab='Output Distances',main='ProjectionMethod', sampleSize=500000)
```

### Arguments

| | |
|---|---|
| `InputDists` | [1:n,1:n] with n cases of data in d variables/features: Matrix containing the distances of the inputspace. |
| `OutputDists` | [1:n,1:n] with n cases of data in d dimensionalites of the projection method variables/features: Matrix containing the distances of the outputspace. |
| `Plotter` | Optional, either `"native"` or `"plotly"` |
| `Type` | Optional, either `"DDCAL"` which creates a special hard color transition sensitive to density-based structures or `"Standard"` which creates a standard continuous color transition which is proven to be not very sensitive for complex density-based structures. |
| `DensityEstimation` | Optional, use either `"SDH"` or `"PDE"` for data density estimation. |
| `Marginals` | Optional, either TRUE (draw Marginals) or FALSE (do not draw Marginals) |
| `xlab` | Label of the x axis in the resulting Plot. |
| `ylab` | Label of the y axis in the resulting Plot. |
| `main` | Title of the Shepard diagram |
| `sampleSize` | Optional, default(500000), reduces a.ount of data for density estimation, if too many distances given |

### Details

Introduced and described in [Thrun, 2018, p. 63] with examples in [Thrun, 2018, p. 71-72]

### Author(s)

Michael Thrun

## References

## Examples

```
data("Lsun3D")
Cls=Lsun3D$Cls
Data=Lsun3D$Data
InputDist=as.matrix(dist(Data))
res = stats::cmdscale(d = InputDist, k = 2, eig = TRUE,
        add = FALSE, x.ret = FALSE)

ProjectedPoints = as.matrix(res$points)
ShepardDensityScatter(InputDist,as.matrix(dist(ProjectedPoints)),main = 'MDS')
ShepardDensityScatter(InputDist[1:100,1:100],

as.matrix(dist(ProjectedPoints))[1:100,1:100],main = 'MDS')
```

---

# Sheparddiagram *Draws a Shepard Diagram*

---

## Description

This function plots a Shepard diagram which is a scatter plot of InputDist and OutputDist

## Usage

```
Sheparddiagram(InputDists, OutputDists, xlab = "Input Distances",

                 ylab= "Output Distances", fancy = F,

 main = "ProjectionMethod", gPlot = ggplot())
```

## Arguments

| | |
|---|---|
| `InputDists` | [1:n,1:n] with n cases of data in d variables/features: Matrix containing the distances of the inputspace. |
| `OutputDists` | [1:n,1:n] with n cases of data in d dimensionalites of the projection method variables/features: Matrix containing the distances of the outputspace. |
| `xlab` | Label of the x axis in the resulting Plot. |
| `ylab` | Label of the y axis in the resulting Plot. |
| `fancy` | Set FALSE for PC and TRUE for publication |
| `main` | Title of the Shepard diagram |
| `gPlot` | ggplot2 object to plot upon. |

### Value

ggplot2 object containing the plot.

### Author(s)

Michael Thrun

### Examples

```
data("Lsun3D")
Cls=Lsun3D$Cls
Data=Lsun3D$Data
InputDist=as.matrix(dist(Data))
res = stats::cmdscale(d = InputDist, k = 2, eig = TRUE,
        add = FALSE, x.ret = FALSE)
ProjectedPoints = as.matrix(res$points)

Sheparddiagram(InputDist,as.matrix(dist(ProjectedPoints)),main = 'MDS')
```

---

`SignedLog` *Signed Log*

---

### Description

Computes the Signed Log if Data

### Usage

```
SignedLog(Data,Base="Ten")
```

### Arguments

| | |
|---|---|
| `Data` | [1:n,1:d] Data matrix with n cases and d variables |
| `Base` | Either "Ten", "Two", "Zero", or any number. |

### Details

A neat transformation for data, it it has a better representation on the log scale.

### Value

Transformed Data

## Note

Number Selections for Base for 2,10, "Two" or "Ten" add 1 to every datapoint as defined in the lectures.

log

## Examples

```
# sampling is done
# because otherwise the example takes too long
# in the CRAN check
data('ITS')
ind=sample(length(ITS),1000)

MDplot(SignedLog(cbind(ITS[ind],MTY[ind])*(-1),Base = "Ten"))
```

---

Silhouetteplot *Silhouette plot of classified data.*

---

## Description

Silhouette plot of cluster silhouettes for the n-by-d data matrix Data or distance matrix where the clusters are defined in the vector Cls.

## Usage

```
Silhouetteplot(DataOrDistances, Cls, method='euclidean',

PlotIt=TRUE,...)
```

## Arguments

DataOrDistances
: [1:n,1:d] data cases in rows, variables in columns, if not symmetric
or
[1:n,1:n] distance matrix, if symmetric

Cls
: numeric vector, [1:n,1] classified data

| | |
|---|---|
| method | Optional if Datamatrix is used, one of "euclidean", "maximum", "manhattan", "canberra", "binary" or "minkowski". Any unambiguous substring can be given, see dist |
| PlotIt | Optional, Default:TRUE, FALSE to supress the plot |
| ... | If PlotIt=TRUE: Further arguements to barplot |

## Details

"The Silhouette plot is a common unsupervised index for visual evaluation of a clustering [L. R. Kaufman/Rousseeuw, 2005] [introduced in [Rousseeuw, 1987]]. A reasonable clustering is characterized by a silhouette width of greater than 0.5, and an average width below 0.2 should be interpreted as indicating a lack of any substantial cluster structure [Everitt et al., 2001, p. 105]. However, it is evident that silhouette scores assume clusters that are spherical or Gaussian in shape [Herrmann, 2011, pp. 91-92]" [Thrun, 2018, p. 29].

## Value

| | |
|---|---|
| silh | Silhouette values in a N-by-1 vector |

## Author(s)

Onno Hansen-Goos, Michael Thrun

## References

[Thrun, 2018] Thrun, M. C.: Projection Based Clustering through Self-Organization and Swarm Intelligence, doctoral dissertation 2017, Springer, ISBN: 978-3-658-20539-3, Heidelberg, 2018.

## Examples

```
data("Lsun3D")
Cls=Lsun3D$Cls
Data=Lsun3D$Data
#clear cluster structure
plot(Data[,1:2],col=Cls)
#However, the silhouette plot does not indicate a very good clustering in cluster 1 and 2
Silhouetteplot(Data,Cls = Cls,main='Silhouetteplot')
```

Slopechart *Slope Chart*

## Description

ABC analysis improved slope chart

## Usage

```
Slopechart(FirstDatavector,

SecondDatavector,

Names,

Labels,

MaxNumberOfSlices,

TopLabels=c('FirstDatavector','SecondDatavector'),

main='Comparision of Descending Frequency')
```

## Arguments

`FirstDatavector`
[1:n] a vector of n non unique values - a features

`SecondDatavector`
[1:m] a vector of n non unique values - a second feature

`Labels` Optional, [1:k] Labels if they are specially named, if not Names are used.

`Names` [1:k] names to search for in Datavector, if not set `unique` of Datavector is calculated.

`MaxNumberOfSlices`
Default is k, integer value defining how many labels will be shown. Everything else will be summed up to `Other`.

`TopLabels` Labels of of feature names

`main` title of the plot

## Details

still experimental.

## Value

silent output by calling `invisible` of a list with

`Percentages` [1:k] percent values visualized in fanplot

`Labels` [1:k] see input `Labels`, only relevant ones

`stat_pde_density` *Calculate Pareto density estimation for ggplot2 plots*

## Description

This function enables to replace the default density estimation for ggplot2 plots with the Pareto density estimation [Ultsch, 2005]. It is used for the PDE-Optimized violin plot published in [Thrun et al, 2018].

## Usage

```
stat_pde_density(mapping = NULL,
                 data = NULL,
                 geom = "violin",
                 position = "dodge",
                 ...,
                 trim = TRUE,
                 scale = "area",
                 na.rm = FALSE,
                 show.legend = NA,
                 inherit.aes = TRUE)
```

## Arguments

| | |
|---|---|
| `mapping` | Set of aesthetic mappings created by `aes()` or `aes_()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping. |
| `data` | The data to be displayed in this layer. There are three options:<br>If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.<br>A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.<br>A `function` will be called with a single argument, the plot data. The return value must be a `data.frame.`, and will be used as the layer data. |
| `geom` | The geometric object to use display the data |
| `position` | Position adjustment, either as a string, or the result of a call to a position adjustment function. |
| `...` | Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `color = "red"` or `size = 3`. They may also be parameters to the paired geom/stat. |
| `trim` | This parameter only matters if you are displaying multiple densities in one plot. If 'FALSE', the default, each density is computed on the full range of the data. If 'TRUE', each density is computed over the range of that group: this typically means the estimated x values will not line-up, and hence you won't be able to stack density values. |

`scale` When used with geom_violin: if "area" (default), all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width", all violins have the same maximum width.

`na.rm` If `FALSE` (the default), removes missing values with a warning. If `TRUE` silently removes missing values.

`show.legend` logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

`inherit.aes` If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. `borders()`.

## Details

Pareto Density Estimation (PDE) is a method for the estimation of probability density functions using hyperspheres. The Pareto-radius of the hyperspheres is derived from the optimization of information for minimal set size. It is shown, that Pareto Density is the best estimate for clusters of Gaussian structure. The method is shown to be robust when cluster overlap and when the variances differ across clusters.

```

## Worldmap *plots a world map by country codes*

### Description

The Worldmap function is used in [Thrun, 2018].

### Usage

```
Worldmap(CountryCodes, Cls, Colors,

MissingCountryColor = grDevices::gray(0.8), ...)
```

### Arguments

| | |
|---|---|
| `CountryCodes` | [1:n] vector of characters identifying countries by ISO 3166 codes (2 or 3 letters) |
| `Cls` | [1:n] numerical vector of classification |
| `Colors` | optional, vector of charcters specifying the used colors |
| `MissingCountryColor` | if not all countries are specified in `CountryCodes` then the color of non relevant countries can be changed here |
| `...` | Further arguments passed on to `plot`, see also `sp::SpatialPolygons-class` |

### Value

List of

| | |
|---|---|
| `Colors` | [1:m] colors used in map, m<=n |
| `CountryCodeList` | [1:m] countries found, m<=n |
| `world_country_polygons` | `SpatialPolygonsDataFrame` |

Worldmap(Codes,Cls)
```

---

world_country_polygons *world_country_polygons*

---

### Description

world_country_polygons shapefile

### Usage

```
data("world_country_polygons")
```

### Format

world_country_polygons stores data objects using classes defined in the sp package or inheriting from those classes updated to sp Y= 1.4 and rgdal >= 1.5.

Since DataVisualization Version 1.2.1 it stores now a CRS objects with a comment containing an WKT2 CRS representation, thanks to a suggestion of Roger Bivand.

## Details

Note that the rebuilt CRS object contains a revised version of the input Proj4 string as well as the WKT2 string, and may be used with both older and newer versions of sp. See maptools package for further details. Also note that since sp >= 2.0 maptools and rgdal were deprecated without change to the workflow. See terra for an alternative to maptools.

## Author(s)

Hamza Tayyab, Michael Thrun

## Source

maptools package

## References

maptools package

## Examples

```
data(world_country_polygons)
str(world_country_polygons)
```

---

`zplot` *Plotting for 3 dimensional data*

---

## Description

Plots z above xy plane as 3D mountain or 2D contourlines

## Usage

```
zplot(x, y, z, DrawTopView = TRUE, NrOfContourLines = 20,

                  TwoDplotter = "native", xlim, ylim)
```

## Arguments

| | |
|---|---|
| x | Vector of x-coordinates of the data. If y and z are missing: Matrix containing 3 rows, one for each coordinate |
| y | Vector of y-coordinates of the data. |
| z | Vector of z-coordinates of the data. |
| DrawTopView | Optional: Boolean, if true plot contours otherwise a 3D plot. Default: True |
| NrOfContourLines | Optional: Numeric. Only used when DrawTopView == True. Number of lines to be drawn in 2D contour plots. Default: 20 |
| TwoDplotter | Optional: String indicating which backend to use for plotting. Possible Values: 'ggplot', 'native', 'plotly' |
| xlim | [1:2] scalar vector setting the limits of x-axis |
| ylim | [1:2] scalar vector setting the limits of y-axis |

## Value

If the plotting backend does support it, this will return a handle for the generated plot.

## Author(s)

Felix pape
