

Package ‘ggstats’

April 5, 2024

Type Package

Title Extension to 'ggplot2' for Plotting Stats

Version 0.6.0

Description Provides new statistics, new geometries and new positions for 'ggplot2' and a suite of functions to facilitate the creation of statistical plots.

License GPL (>= 3)

URL <https://larmarange.github.io/ggstats/>,
<https://github.com/larmarange/ggstats>

BugReports <https://github.com/larmarange/ggstats/issues>

Imports broom.helpers (>= 1.14.0), cli, dplyr, forcats, ggplot2 (>= 3.4.0), lifecycle, magrittr, patchwork, purrr, rlang, scales, stats, stringr, tidyverse

Suggests betareg, broom, emmeans, glue, knitr, labelled (>= 2.11.0), reshape, rmarkdown, nnet, parameters, pscl, testthat (>= 3.0.0), spelling, survey, survival, vdiffR

Encoding UTF-8

RoxygenNote 7.3.1

Config/testthat/edition 3

Language en-US

VignetteBuilder knitr

NeedsCompilation no

`augment_chisq_add_phi` *Augment a chi-squared test and compute phi coefficients*

Description

Augment a chi-squared test and compute phi coefficients

Usage

```
augment_chisq_add_phi(x)
```

Arguments

`x` a chi-squared test as returned by `stats:::chisq.test()`

Details

Phi coefficients are a measurement of the degree of association between two binary variables.

- A value between -1.0 to -0.7 indicates a strong negative association.
- A value between -0.7 to -0.3 indicates a weak negative association.
- A value between -0.3 to +0.3 indicates a little or no association.
- A value between +0.3 to +0.7 indicates a weak positive association.
- A value between +0.7 to +1.0 indicates a strong positive association.

Value

A tibble.

See Also

[stat_cross\(\)](#), `GDAtools::phi.table()` or `psych::phi()`

Examples

```
tab <- xtabs(Freq ~ Sex + Class, data = as.data.frame(Titanic))
augment_chisq_add_phi(chisq.test(tab))
```

geom_stripped_rows *Alternating Background Color*

Description

Add alternating background color along the y-axis. The geom takes default aesthetics odd and even that receive color codes.

Usage

```
geom_stripped_rows(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  show.legend = NA,
  inherit.aes = TRUE,
  xfrom = -Inf,
  xto = Inf,
  width = 1,
  nudge_y = 0
)

geom_stripped_cols(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  show.legend = NA,
  inherit.aes = TRUE,
  yfrom = -Inf,
  yto = Inf,
  width = 1,
  nudge_x = 0
)
```

Arguments

<code>mapping</code>	Set of aesthetic mappings created by aes() . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
<code>data</code>	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to ggplot() . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a <code>formula</code> (e.g. <code>~ head(.x, 10)</code>).
<code>stat</code>	The statistical transformation to use on the data for this layer, either as a <code>ggproto</code> <code>Geom</code> subclass or as a string naming the stat stripped of the <code>stat_</code> prefix (e.g. "count" rather than "stat_count")
<code>position</code>	Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use <code>position_jitter</code>), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.
<code>...</code>	Other arguments passed on to layer() . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
<code>show.legend</code>	logical. Should this layer be included in the legends? <code>NA</code> , the default, includes if any aesthetics are mapped. <code>FALSE</code> never includes, and <code>TRUE</code> always includes. It can also be a named logical vector to finely select the aesthetics to display.
<code>inherit.aes</code>	If <code>FALSE</code> , overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders() .
<code>xfrom, xto</code>	limitation of the strips along the x-axis
<code>width</code>	width of the strips
<code>yfrom, yto</code>	limitation of the strips along the y-axis
<code>nudge_x, nudge_y</code>	horizontal or vertical adjustment to nudge strips by

Value

A `ggplot2` plot with the added geometry.

Examples

```
data(tips, package = "reshape")

library(ggplot2)
p <- ggplot(tips) +
```

```

aes(x = time, y = day) +
geom_count() +
theme_light()

p
p + geom_stripped_rows()
p + geom_stripped_cols()
p + geom_stripped_rows() + geom_stripped_cols()

p <- ggplot(tips) +
aes(x = total_bill, y = day) +
geom_count() +
theme_light()
p
p + geom_stripped_rows()
p + geom_stripped_rows() + scale_y_discrete(expand = expansion(0, 0.5))
p + geom_stripped_rows(xfrom = 10, xto = 35)
p + geom_stripped_rows(odd = "blue", even = "yellow")
p + geom_stripped_rows(odd = "blue", even = "yellow", alpha = .1)
p + geom_stripped_rows(odd = "#00FF0022", even = "#FF000022")

p + geom_stripped_cols()
p + geom_stripped_cols(width = 10)
p + geom_stripped_cols(width = 10, nudge_x = 5)

```

ggcoef_model*Plot model coefficients***Description**

`ggcoef_model()`, `ggcoef_table()`, `ggcoef_multinom()`, `ggcoef_multicomponents()` and `ggcoef_compare()` use `broom.helpers::tidy_plus_plus()` to obtain a tibble of the model coefficients, apply additional data transformation and then pass the produced tibble to `ggcoef_plot()` to generate the plot.

Usage

```

ggcoef_model(
  model,
  tidy_fun = broom.helpers::tidy_with_broom_or_parameters,
  tidy_args = NULL,
  conf.int = TRUE,
  conf.level = 0.95,
  exponentiate = FALSE,
  variable_labels = NULL,
  term_labels = NULL,

```

```
interaction_sep = " * ",
categorical_terms_pattern = "{level}",
add_reference_rows = TRUE,
no_reference_row = NULL,
intercept = FALSE,
include = dplyr::everything(),
add_pairwise_contrasts = FALSE,
pairwise_variables = broom.helpers::all_categorical(),
keep_model_terms = FALSE,
pairwise_reverse = TRUE,
emmeans_args = list(),
significance = 1 - conf.level,
significance_labels = NULL,
show_p_values = TRUE,
signif_stars = TRUE,
return_data = FALSE,
...
)

ggcoef_table(
  model,

  errorbar = TRUE,
  errorbar_height = 0.1,
  errorbar_coloured = FALSE,
  stripped_rows = TRUE,
  strips_odd = "#11111111",
  strips_even = "#00000000",
  vline = TRUE,
  vline_colour = "grey50",
  dodged = FALSE,
  dodged_width = 0.8,
  facet_row = "var_label",
  facet_col = NULL,
  facet_labeller = "label_value"
)

```

Arguments

<code>model</code>	a regression model object
<code>tidy_fun</code>	option to specify a custom tidier function
<code>tidy_args</code>	Additional arguments passed to <code>broom.helpers::tidy_plus_plus()</code> and to <code>tidy_fun</code>
<code>conf.int</code>	should confidence intervals be computed? (see <code>broom::tidy()</code>)
<code>conf.level</code>	the confidence level to use for the confidence interval if <code>conf.int = TRUE</code> ; must be strictly greater than 0 and less than 1; defaults to 0.95, which corresponds to a 95 percent confidence interval
<code>exponentiate</code>	if TRUE a logarithmic scale will be used for x-axis
<code>variable_labels</code>	a named list or a named vector of custom variable labels
<code>term_labels</code>	a named list or a named vector of custom term labels
<code>interaction_sep</code>	separator for interaction terms
<code>categorical_terms_pattern</code>	a glue pattern for labels of categorical terms with treatment or sum contrasts (see <code>model_list_terms_levels()</code>)
<code>add_reference_rows</code>	should reference rows be added?

no_reference_row
variables (accepts `tidyselect` notation) for those no reference row should be added, when `add_reference_rows = TRUE`

intercept
should the intercept(s) be included?

include
variables to include. Accepts `tidyselect` syntax. Use - to remove a variable. Default is `everything()`. See also `all_continuous()`, `all_categorical()`, `all_dichotomous()` and `all_interaction()`

add_pairwise_contrasts
apply `tidy_add_pairwise_contrasts()`? [Experimental]

pairwise_variables
variables to add pairwise contrasts (accepts `tidyselect` notation)

keep_model_terms
keep original model terms for variables where pairwise contrasts are added? (default is FALSE)

pairwise_reverse
determines whether to use "pairwise" (if TRUE) or "retpairwise" (if FALSE), see `emmeans::contrast()`

emmeans_args
list of additional parameter to pass to `emmeans::emmeans()` when computing pairwise contrasts

significance
level (between 0 and 1) below which a coefficient is consider to be significantly different from 0 (or 1 if `exponentiate = TRUE`), NULL for not highlighting such coefficients

significance_labels
optional vector with custom labels for significance variable

show_p_values
if TRUE, add p-value to labels

signif_stars
if TRUE, add significant stars to labels

return_data
if TRUE, will return the data.frame used for plotting instead of the plot

...
parameters passed to `ggcoef_plot()`

table_stat
statistics to display in the table, use any column name returned by the tidier or "ci" for confidence intervals formatted according to `ci_pattern`

table_header
optional custom headers for the table

table_text_size
text size for the table

table_stat_label
optional named list of labeller functions for the displayed statistic (see examples)

ci_pattern
glue pattern for confidence intervals in the table

table_widths
relative widths of the forest plot and the coefficients table

plot_title
an optional plot title

models
named list of models

type
a dodged plot, a faceted plot or multiple table plots?

y.level_label
an optional named vector for labeling `y.level` (see examples)

component_col
name of the component column

component_label	an optional named vector for labeling components
data	a data frame containing data to be plotted, typically the output of <code>ggcoef_model()</code> , <code>ggcoef_compare()</code> or <code>ggcoef_multinom()</code> with the option <code>return_data = TRUE</code>
x, y	variables mapped to x and y axis
point_size	size of the points
point_stroke	thickness of the points
point_fill	fill colour for the points
colour	optional variable name to be mapped to colour aesthetic
colour_guide	should colour guide be displayed in the legend?
colour_lab	label of the colour aesthetic in the legend
colour_labels	labels argument passed to <code>ggplot2::scale_colour_discrete()</code> and <code>ggplot2::discrete_scale()</code>
shape	optional variable name to be mapped to the shape aesthetic
shape_values	values of the different shapes to use in <code>ggplot2::scale_shape_manual()</code>
shape_guide	should shape guide be displayed in the legend?
shape_lab	label of the shape aesthetic in the legend
errorbar	should error bars be plotted?
errorbar_height	height of error bars
errorbar_coloured	should error bars be colored as the points?
stripped_rows	should stripped rows be displayed in the background?
strips_odd	color of the odd rows
strips_even	color of the even rows
vline	should a vertical line be drawn at 0 (or 1 if <code>exponentiate = TRUE</code>)?
vline_colour	colour of vertical line
dodged	should points be dodged (according to the colour aesthetic)?
dodged_width	width value for <code>ggplot2::position_dodge()</code>
facet_row	variable name to be used for row facets
facet_col	optional variable name to be used for column facets
facet_labeller	labeller function to be used for labeling facets; if labels are too long, you can use <code>ggplot2::label_wrap_gen()</code> (see examples), more information in the documentation of <code>ggplot2::facet_grid()</code>

Details

For more control, you can use the argument `return_data = TRUE` to get the produced tibble, apply any transformation of your own and then pass your customized tibble to `ggcoef_plot()`.

Value

A `ggplot2` plot or a tibble if `return_data = TRUE`.

Functions

- `ggcoef_table()`: a variation of `ggcoef_model()` adding a table with estimates, confidence intervals and p-values
- `ggcoef_compare()`: designed for displaying several models on the same plot.
- `ggcoef_multinom()`: a variation of `ggcoef_model()` adapted to multinomial logistic regressions performed with `nnet::multinom()`.
- `ggcoef_multicomponents()`: a variation of `ggcoef_model()` adapted to multi-component models such as zero-inflated models or beta regressions. `ggcoef_multicomponents()` has been tested with `pscl::zeroinfl()`, `pscl::hurdle()` and `betareg::betareg()`
- `ggcoef_plot()`: plot a tidy tibble of coefficients

Arguments

<code>data</code>	a data frame
<code>include</code>	variables to include, accepts tidy-select syntax
<code>weights</code>	optional variable name of a weighting variable, accepts tidy-select syntax
<code>y</code>	name of the variable to be plotted on y axis (relevant when <code>.question</code> is mapped to "facets, see examples), accepts tidy-select syntax
<code>variable_labels</code>	a named list or a named vector of custom variable labels
<code>sort</code>	should the factor defined by <code>factor_to_sort</code> be sorted according to the answers (see <code>sort_method</code>)? One of "none" (default), "ascending" or "descending"
<code>sort_method</code>	method used to sort the variables: "prop" sort according to the proportion of answers higher than the centered level, "mean" considers answer as a score and sort according to the mean score, "median" used the median and the majority judgment rule for tie-breaking.
<code>sort_prop_include_center</code>	when sorting with "prop" and if the number of levels is uneven, should half of the central level be taken into account to compute the proportion?
<code>factor_to_sort</code>	name of the factor column to sort if <code>sort</code> is not equal to "none"; by default the list of questions passed to <code>include</code> ; should be one factor column of the tibble returned by <code>gglkert_data()</code> ; accepts tidy-select syntax

```

exclude_fill_values
  Vector of values that should not be displayed (but still taken into account for
  computing proportions), see position\_likert\(\)
data_fun
  for advanced usage, custom function to be applied to the generated dataset at the
  end of gglikert_data()
add_labels
  should percentage labels be added to the plot?
labels_size
  size of the percentage labels
labels_color
  color of the percentage labels ("auto" to use hex_bw() to determine a font color
  based on background color)
labels_accuracy
  accuracy of the percentages, see scales::label\_percent\(\)
labels_hide_below
  if provided, values below will be masked, see label\_percent\_abs\(\)
add_totals
  should the total proportions of negative and positive answers be added to plot?
This option is not compatible with facets!
totals_size
  size of the total proportions
totals_color
  color of the total proportions
totals_accuracy
  accuracy of the total proportions, see scales::label\_percent\(\)
totals_fontface
  font face of the total proportions
totals_include_center
  if the number of levels is uneven, should half of the center level be added to the
  total proportions?
totals_hjust
  horizontal adjustment of totals labels on the x axis
y_reverse
  should the y axis be reversed?
y_label_wrap
  number of characters per line for y axis labels, see scales::label\_wrap\(\)
reverse_likert
  if TRUE, will reverse the default stacking order, see position\_likert\(\)
width
  bar width, see ggplot2::geom\_bar\(\)
facet_rows, facet_cols
  A set of variables or expressions quoted by ggplot2::vars\(\) and defining
  faceting groups on the rows or columns dimension (see examples)
facet_label_wrap
  number of characters per line for facet labels, see ggplot2::label\_wrap\_gen\(\)
add_median_line
  add a vertical line at 50%?
reverse_fill
  if TRUE, will reverse the default stacking order, see ggplot2::position\_fill\(\)

```

Details

Combines several factor variables using the same list of ordered levels (e.g. Likert-type scales) into a unique data frame and generates a centered bar plot.

You could use gglikert_data() to just produce the dataset to be plotted.

If variable labels have been defined (see [labelled::var_label\(\)](#)), they will be considered. You can also pass custom variables labels with the variable_labels argument.

Value

A `ggplot2` plot or a `tibble`.

```

Description

A function to facilitate `ggplot2` graphs using a survey object. It will initiate a `ggplot` and map survey weights to the corresponding aesthetic.

Usage

```
ggsurvey(design = NULL, mapping = NULL, ...)
```

Arguments

<code>design</code>	A survey design object, usually created with survey::svydesign()
<code>mapping</code>	Default list of aesthetic mappings to use for plot, to be created with ggplot2::aes() .
<code>...</code>	Other arguments passed on to methods. Not currently used.

Details

Graphs will be correct as long as only weights are required to compute the graph. However, statistic or geometry requiring correct variance computation (like [ggplot2::geom_smooth\(\)](#)) will be statistically incorrect.

Value

A `ggplot2` plot.

Examples

```
data(api, package = "survey")
dstrat <- survey::svydesign(
  id = ~1, strata = ~stype,
  weights = ~pw, data = apistrat,
  fpc = ~fpc
)
ggsurvey(dstrat) +
  ggplot2::aes(x = cnum, y = dnum) +
  ggplot2::geom_count()

d <- as.data.frame(Titanic)
dw <- survey::svydesign(ids = ~1, weights = ~Freq, data = d)
ggsurvey(dw) +
  ggplot2::aes(x = Class, fill = Survived) +
  ggplot2::geom_bar(position = "fill")
```

hex_bw	<i>Identify a suitable font color (black or white) given a background HEX color</i>
--------	---

Description

Identify a suitable font color (black or white) given a background HEX color

Usage

```
hex_bw(hex_code)
```

Arguments

hex_code	Background color in hex-format.
----------	---------------------------------

Value

Either black or white, in hex-format

Source

Adapted from saros

Examples

```
hex_bw("#0dadfd")
```

label_number_abs	<i>Label absolute values</i>
------------------	------------------------------

Description

Label absolute values

Usage

```
label_number_abs(..., hide_below = NULL)
```

```
label_percent_abs(..., hide_below = NULL)
```

Arguments

...	arguments passed to <code>scales::label_number()</code> or <code>scales::label_percent()</code>
hide_below	if provided, values below hide_below will be masked (i.e. an empty string "" will be returned)

Value

A "labelling" function, , i.e. a function that takes a vector and returns a character vector of same length giving a label for each input value.

See Also

[scales::label_number\(\)](#), [scales::label_percent\(\)](#)

Examples

```
x <- c(-0.2, -.05, 0, .07, .25, .66)

scales::label_number()(x)
label_number_abs()(x)

scales::label_percent()(x)
label_percent_abs()(x)
label_percent_abs(hide_below = .1)(x)
```

position_likert

Stack objects on top of each another and center them around 0

Description

[Experimental]

Usage

```
position_likert(vjust = 1, reverse = FALSE, exclude_fill_values = NULL)
position_likert_count(vjust = 1, reverse = FALSE, exclude_fill_values = NULL)
```

Arguments

vjust	Vertical adjustment for geoms that have a position (like points or lines), not a dimension (like bars or areas). Set to 0 to align with the bottom, 0.5 for the middle, and 1 (the default) for the top.
reverse	If TRUE, will reverse the default stacking order. This is useful if you're rotating both the plot and legend.
exclude_fill_values	Vector of values from the variable associated with the fill aesthetic that should not be displayed (but still taken into account for computing proportions)

Details

`position_likert()` stacks proportion bars on top of each other and center them around zero (the same number of modalities are displayed on each side). This type of presentation is commonly used to display Likert-type scales. `position_likert_count()` uses counts instead of proportions.

It is recommended to use `position_likert()` with `stat_prop()` and its `complete` argument (see examples).

    stat = "prop",
    position = position_likert(vjust = .5)
  ) +
  scale_x_continuous(label = label_percent_abs()) +
  scale_fill_brewer(palette = "PiYG", direction = -1) +
  xlab("proportion")

# Do not display specific fill values -----
# (but taken into account to compute proportions)

ggplot(diamonds) +
  aes(y = clarity, fill = cut) +
  geom_bar(position = position_likert(exclude_fill_values = "Very Good")) +
  scale_x_continuous(label = label_percent_abs()) +
  scale_fill_brewer(palette = "PiYG") +
  xlab("proportion")

```

Description

Round to multiple of any number.

Usage

```
round_any(x, accuracy, f = round)
```

Arguments

x	numeric or date-time (POSIXct) vector to round
accuracy	number to round to; for POSIXct objects, a number of seconds
f	rounding function: floor , ceiling or round

Source

adapted from [plyr](#)

Examples

```
round_any(1.865, accuracy = .25)
```

signif_stars

Significance Stars

Description

Calculate significance stars

Usage

```
signif_stars(x, three = 0.001, two = 0.01, one = 0.05, point = 0.1)
```

Arguments

x	numeric values that will be compared to the point, one, two, and three values
three	threshold below which to display three stars
two	threshold below which to display two stars
one	threshold below which to display one star
point	threshold below which to display one point (NULL to deactivate)

Value

Character vector containing the appropriate number of stars for each x value.

Author(s)

Joseph Larmarange

Examples

```
x <- c(0.5, 0.1, 0.05, 0.01, 0.001)
signif_stars(x)
signif_stars(x, one = .15, point = NULL)
```

stat_cross

Compute cross-tabulation statistics

Description

Computes statistics of a 2-dimensional matrix using [broom::augment.htest](#).

Usage

```
stat_cross(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  ...,
  na.rm = TRUE,
  show.legend = NA,
  inherit.aes = TRUE,
  keep.zero.cells = FALSE
)
```

Arguments

mapping	Set of aesthetic mappings created by aes() . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
data	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to ggplot() . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
geom	Override the default connection with ggplot2::geom_point() .
position	Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use <code>position_jitter</code>), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.

...	Other arguments passed on to layer() . These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.
na.rm	If TRUE, the default, missing values are removed with a warning. If FALSE, missing values are silently removed.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders() .
keep.zero.cells	If TRUE, cells with no observations are kept.

Value

A ggplot2 plot with the added statistic.

Aesthetics

`stat_cross()` requires the **x** and the **y** aesthetics.

Computed variables

observed	number of observations in x,y
prop	proportion of total
row.prop	row proportion
col.prop	column proportion
expected	expected count under the null hypothesis
resid	Pearson's residual
std.resid	standardized residual
row.observed	total number of observations within row
col.observed	total number of observations within column
total.observed	total number of observations within the table
phi	phi coefficients, see augment_chisq_add_phi()

See Also

`vignette("stat_cross")`

Examples

```

library(ggplot2)
d <- as.data.frame(Titanic)

# plot number of observations
ggplot(d) +
  aes(x = Class, y = Survived, weight = Freq, size = after_stat(observed)) +
  stat_cross() +
  scale_size_area(max_size = 20)

# custom shape and fill colour based on chi-squared residuals
ggplot(d) +
  aes(
    x = Class, y = Survived, weight = Freq,
    size = after_stat(observed), fill = after_stat(std.resid)
  ) +
  stat_cross(shape = 22) +
  scale_fill_steps2(breaks = c(-3, -2, 2, 3), show.limits = TRUE) +
  scale_size_area(max_size = 20)

# custom shape and fill colour based on phi coeffients
ggplot(d) +
  aes(
    x = Class, y = Survived, weight = Freq,
    size = after_stat(observed), fill = after_stat(phi)
  ) +
  stat_cross(shape = 22) +
  scale_fill_steps2(show.limits = TRUE) +
  scale_size_area(max_size = 20)

# plotting the number of observations as a table
ggplot(d) +
  aes(
    x = Class, y = Survived, weight = Freq, label = after_stat(observed)
  ) +
  geom_text(stat = "cross")

# Row proportions with standardized residuals
ggplot(d) +
  aes(
    x = Class, y = Survived, weight = Freq,
    label = scales::percent(after_stat(row.prop)),
    size = NULL, fill = after_stat(std.resid)
  ) +
  stat_cross(shape = 22, size = 30) +
  geom_text(stat = "cross") +
  scale_fill_steps2(breaks = c(-3, -2, 2, 3), show.limits = TRUE) +
  facet_grid(Sex ~ .) +
  labs(fill = "Standardized residuals") +
  theme_minimal()

```

stat_prop*Compute proportions according to custom denominator*

Description

`stat_prop()` is a variation of [ggplot2::stat_count\(\)](#) allowing to compute custom proportions according to the **by** aesthetic defining the denominator (i.e. all proportions for a same value of **by** will sum to 1). The **by** aesthetic should be a factor. If **by** is not specified, proportions of the total will be computed.

Usage

```
stat_prop(
  mapping = NULL,
  data = NULL,
  geom = "bar",
  position = "fill",
  ...,
  width = NULL,
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE,
  complete = NULL
)
```

Arguments

mapping	Set of aesthetic mappings created by aes() . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
data	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to ggplot() . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
geom	Override the default connection with ggplot2::geom_bar() .
position	Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use <code>position_jitter</code>), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.

...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
<code>width</code>	Bar width. By default, set to 90% of the <code>resolution()</code> of the data.
<code>na.rm</code>	If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
<code>orientation</code>	The orientation of the layer. The default (NA) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting <code>orientation</code> to either "x" or "y". See the <i>Orientation</i> section for more detail.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders()</code> .
<code>complete</code>	Name (character) of an aesthetic for those statistics should be completed for unobserved values (see example)

Value

A ggplot2 plot with the added statistic.

Aesthetics

`stat_prop()` understands the following aesthetics (required aesthetics are in bold):

- **x or y**
- `by` (this aesthetic should be a **factor**)
- `group`
- `weight`

Computed variables

count number of points in bin

prop computed proportion

See Also

`vignette("stat_prop")`, `ggplot2::stat_count()`. For an alternative approach, see <https://github.com/tidyverse/ggplot2/issues/5505#issuecomment-1791324008>.

Examples

```

library(ggplot2)
d <- as.data.frame(Titanic)

p <- ggplot(d) +
  aes(x = Class, fill = Survived, weight = Freq, by = Class) +
  geom_bar(position = "fill") +
  geom_text(stat = "prop", position = position_fill(.5))
p
p + facet_grid(~Sex)

ggplot(d) +
  aes(x = Class, fill = Survived, weight = Freq) +
  geom_bar(position = "dodge") +
  geom_text(
    aes(by = Survived),
    stat = "prop",
    position = position_dodge(0.9), vjust = "bottom"
  )

if (requireNamespace("scales")) {
  ggplot(d) +
    aes(x = Class, fill = Survived, weight = Freq, by = 1) +
    geom_bar() +
    geom_text(
      aes(label = scales::percent(after_stat(prop), accuracy = 1)),
      stat = "prop",
      position = position_stack(.5)
    )
}

# displaying unobserved levels with complete
d <- diamonds %>%
  dplyr::filter(!(cut == "Ideal" & clarity == "I1")) %>%
  dplyr::filter(!(cut == "Very Good" & clarity == "VS2")) %>%
  dplyr::filter(!(cut == "Premium" & clarity == "IF"))
p <- ggplot(d) +
  aes(x = clarity, fill = cut, by = clarity) +
  geom_bar(position = "fill")
p + geom_text(stat = "prop", position = position_fill(.5))
p + geom_text(stat = "prop", position = position_fill(.5), complete = "fill")

```

stat_weighted_mean *Compute weighted y mean*

Description

This statistic will compute the mean of **y** aesthetic for each unique value of **x**, taking into account **weight** aesthetic if provided.

Usage

```
stat_weighted_mean(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  ...,
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE
)
```

Arguments

<code>mapping</code>	Set of aesthetic mappings created by <code>aes()</code> . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
<code>data</code>	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
<code>geom</code>	Override the default connection with <code>ggplot2::geom_point()</code> .
<code>position</code>	Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use <code>position_jitter</code>), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.
<code>...</code>	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
<code>na.rm</code>	If <code>FALSE</code> , the default, missing values are removed with a warning. If <code>TRUE</code> , missing values are silently removed.
<code>orientation</code>	The orientation of the layer. The default (<code>NA</code>) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting <code>orientation</code> to either "x" or "y". See the <i>Orientation</i> section for more detail.
<code>show.legend</code>	logical. Should this layer be included in the legends? <code>NA</code> , the default, includes if any aesthetics are mapped. <code>FALSE</code> never includes, and <code>TRUE</code> always includes. It can also be a named logical vector to finely select the aesthetics to display.
<code>inherit.aes</code>	If <code>FALSE</code> , overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders()</code> .

Value

A ggplot2 plot with the added statistic.

Computed variables

y weighted y (numerator / denominator)
numerator numerator
denominator denominator

    labs(y = "Survived")
}
```

weighted.median *Weighted Median and Quantiles*

Description

Compute the median or quantiles a set of numbers which have weights associated with them.

Usage

```
weighted.median(x, w, na.rm = TRUE, type = 2)

weighted.quantile(x, w, probs = seq(0, 1, 0.25), na.rm = TRUE, type = 4)
```

Arguments

x	a numeric vector of values
w	a numeric vector of weights
na.rm	a logical indicating whether to ignore NA values
type	Integer specifying the rule for calculating the median or quantile, corresponding to the rules available for <code>stats:quantile()</code> . The only valid choices are type=1, 2 or 4. See Details.
probs	probabilities for which the quantiles should be computed, a numeric vector of values between 0 and 1

Details

The i th observation $x[i]$ is treated as having a weight proportional to $w[i]$.

The weighted median is a value m such that the total weight of data less than or equal to m is equal to half the total weight. More generally, the weighted quantile with probability p is a value q such that the total weight of data less than or equal to q is equal to p times the total weight.

If there is no such value, then

- if type = 1, the next largest value is returned (this is the right-continuous inverse of the left-continuous cumulative distribution function);
- if type = 2, the average of the two surrounding values is returned (the average of the right-continuous and left-continuous inverses);
- if type = 4, linear interpolation is performed.

Note that the default rule for `weighted.median()` is type = 2, consistent with the traditional definition of the median, while the default for `weighted.quantile()` is type = 4.

Value

A numeric vector.

Source

These functions are adapted from their homonyms developed by Adrian Baddeley in the `spatstat` package.

Examples

```
x <- 1:20
w <- runif(20)
weighted.median(x, w)
weighted.quantile(x, w)
```
